and social sciences Each chapter includes questions for students and an annotated reading list to dive deeper into the associated chapter material The book aims to provide readers with as wide an exposure as possible to digital advances and their consequences for humanity It includes constructive ideas and approaches that seek to ensure that our collective digital future is determined through human agency

Introduction to Artificial Intelligence Tommy Trappen, 2024-09-09

playing poorly but learned to play better by playing many games against itself Growing to play better than Samuel this program disproved the still made argument that computers can only do what they are told to do A particularly good example of how a simple set of rules can produce seemingly complex behavior was Joseph Weizenbaum's Eliza program which simulates a Rogerian psychotherapist Although Eliza's algorithms are best described as simple pattern matching and it was not intended as a serious attempt at machine intelligence it still produced appropriate responses to a variety of statements Because of programs like Eliza there was also a hope of building systems in the near future that would pass the Turing Test for machine intelligence In the Turing Test a human judge sits at a computer terminal and chats via instant messenger with one of two entities either a human or an AI computer program The human and computer would each try to convince the human judge that they are the human If the judge is unable tell whether she is chatting with a human or the AI program then the AI program passes the Turing Test Turing considered this a sufficient but not necessary condition for intelligence since a machine could be intelligent without being able to impersonate a human Things seemed very rosy Herb Simon in 1957 said It is not my aim to surprise or shock you but the simplest way I can summarize is to say that there are now in the world machines that think that learn and that create Moreover their ability to do these things is going to increase rapidly until in a visible future the range of problems they can handle will be coextensive with the range to which human mind has been applied More precisely within 10 years a computer would be chess champion and an important new mathematical theorem would be proved by a computer Both of these milestones have now been achieved by computers but each took closer to 40 years rather than 10 After the initial enthusiasm there was the dawning realization that problems are much harder than one originally thought and that simple tricks don't work For instance one of Eliza's rules was that if the user utters the word mother then respond Tell me more about your family This sometimes works well but it can also generate some very unnatural responses For example if you say I wanted to adopt a puppy but it's too young to be separated from its mother Eliza may also respond Tell me more about your family Another example was machine translation Much time and money were spent following Sputnik's launch in 1957 on developing systems to automatically translate Russian documents into English This turned out to be a very hard problem since much specialized knowledge seems to be required to understand language A famous example The spirit is willing but the flesh is weak was translated into Russian and then retranslated back into English giving 1 2 Approaches to AI 3 The vodka is strong but the meat is rotten At that point people realized two things that made the AI problem much harder than they had originally thought 1 In order to do a good job in any realistic task simple syntactic

manipulation i.e. simple rules to shuffle words around or do Russian to English dictionary lookups is not good enough. Instead we must have enough knowledge about the world to really understand what's being said so as to reason more deeply about it. For example in the translation example we need to understand that spirit refers to the metaphorical or mystical human spirit rather than to alcohol. 2 Computational intractability. The AI goal was defined before the theory of NP completeness was developed. At that point people thought that to deal with larger problems we need only larger faster computers. In particular the phenomena of exponential scaling in which the computation scales exponentially with the size of the problem was not yet understood. Many early AI methods required solving NP hard problems and therefore did not scale well to larger problems.
