Immune Profile after Autologous Hematopoietic Stem Cell Transplantation for Autoimmune Diseases: Where Do We Stand? Kelen Cristina Ribeiro Malmegrim, Maria Carolina Oliveira, Antoine Toubert, Dominique Farge-Bancel, 2020-02-12 Autologous hematopoietic stem cell transplantation AHSCT was proposed 20 years ago as an alternative therapeutic approach for patients with severe and refractory autoimmune diseases Since then this innovative therapy has been successfully used to treat several autoimmune diseases such as neurological disorders Multiple Sclerosis connective tissue diseases Systemic Sclerosis and Systemic Lupus Erythematosus gastrointestinal inflammatory diseases Crohn's Disease and others Juvenile Arthritis Type 1 Diabetes Vasculitis Experience in phase I II and III clinical trials over the years has led to increased safety and efficacy of this procedure Recent studies have demonstrated superior therapeutic efficacy of AHSCT versus conventional therapies showing that transplantation can induce long term disease remission in the absence of any further immunosuppressive treatment Immune monitoring studies have showed that AHSCT is able to reduce the inflammatory milieu to reset the immune balance and to promote the generation of a new auto tolerant immune repertoire However some patients fail to remain in remission and disease is re activated after some time post transplantation This scenario indicates that further immunological interventions may be still required to improve AHSCT efficacy Clear understanding of the operating immune mechanisms that contribute to specific clinical outcomes is vital to enable improvement of AHSCT protocols for autoimmune diseases

Human Stem Cell Toxicology James L Sherley, 2016-08-09 Toxicity against tissue stem cells TSCs is a major problem in drug development and environmental health science Despite their essential function in all human cellular tissues the nature of tissue stem cells is not fully understood The small fraction of stem cells in tissues and the lack of specific biomarkers for their quantification present a formidable challenge to developing tools for their study and assays that can identify stem cell toxic agents Human Stem Cell Toxicology reveals TSC toxicity as a biomedical reality that is now well under siege by newly emerging ideas and technologies despite these challenges Chapters consider stem cell toxicity by environmental agents pharmaceutical drug candidates and marketed therapeutic medicines with adverse side effects New insights to cellular molecular biochemical and

chemical mechanisms of human tissue stem cell toxicity are brought together Experimental and theoretical treatments are of specific topics including approaches to monitoring TSC function newly discovered TSC types and TSC toxicity resistance mechanisms are covered by expert authors This book informs and champions the continued development of innovative technologies to predict the TSC toxicity of compounds before their use whether in patients or the environment by addressing emerging new cell based approaches and concepts for technical innovation This publication will be a useful reference for postgraduate students and researchers working in toxicology pharmaceutical science tissue cell biology and stem cell biology
