

LABORATORY 3: SILICICLASTIC PETROGRAPHY

Faculty/Department Faculty of Earth Science/Geoscience Department

Programme: Geoscience

Course Name: Sedimentology (EGE 3083)

Name of Course Coordinator: Dr. Hafzan Eva Binti Mansor

1.0 Task

Students are given one thin section sample during laboratory class and microphotograph of FOUR (4) sandstone samples (Sample 1, Sample 2, Sample 3, and Sample 4; see Appendix 1).

For the thin section sample given during laboratory class and the FOUR (4) sandstone samples:

- a. Do microscopic drawings
- b. Explain sphericity, roundness, sorting, maturity, and grain contact. Label if necessary
- c. Label grains, cement, pores etc. in your microscopic drawings (e.g. monocrystalline quartz (Qm); polycrystalline quartz (Qp); feldspar (F); rock fragments/lithics (RF); micas; heavy minerals; other constituents)
- d. Sandstone classification, provenance, and tectonic provinces
 - i. Conduct point counting and record your result in table form. Note: Table 1 is an example to record your point counting result.
 - ii. Plot the percentage of Q-F-L in McBride (1963) triangle classification for sandstone classification (Figure 9)
 - iii. Plot the percentage of Qt-F-L and Qm-F-L in W.R. Dickinson's models provenance and tectonic provinces (Figure 10)
- e. Provide discussion and conclusion based on a – d

2.0 Report Rubric

Refer Table 1.

3.0 Dateline policy

Failure to hand in assignments/lab exercises on time will result in a grade penalty. Mark: will be docked 10% of points for each late day. The first "late day" begins immediately after the deadline. Student will get zero (0) mark if no work handed in.

Petrography Laboratory Manual Loren A. Raymond, 2005

Petrography of Igneous and Metamorphic Rocks Anthony R. Philpotts, 2003-04-15 This comprehensive laboratory manual teaches students taking their first course in petrography the techniques of describing and classifying rocks as well as how to apply those techniques to common igneous and metamorphic rocks. Essential features include a listing of common minerals with their most important distinguishing optical properties, over two hundred illustrations detailing the relation between optics and crystal morphology, color slides illustrating rock-forming minerals and the textures of rocks, many with text and audio annotations by the author, see download below, descriptions of the textures and structures of igneous and metamorphic rocks, the most important properties of all the minerals compiled in an easy-to-access full-color table and a chart for determining the approximate modal volume percentage of minerals in rocks. The classification of igneous rocks used in the book is the one proposed by the International Union of Geological Sciences (IUGS) Subcommittee of the Systematics of Igneous Rocks. A list of commonly used rock names, many not part of the IUGS classification, is keyed to this classification. Also, the widely used Irvine-Baragar classification of volcanic rocks is included. Dr. Philpotts has organized a large amount of information to be easily and rapidly accessible. He provides students with a concrete fou

Petrography and Geochemistry of Precambrian Rocks from GT-2 and EE-1 Alexander William Laughlin, 1977 During the drilling of GT 2 and EE 1, 27 cores totaling about 35 m were collected from the Precambrian section. Samples of each different lithology in each core were taken for petrographic and whole-rock major and trace element analyses. Whole-rock analyses are now completed on 37 samples. From these data, four major Precambrian units were identified at the Fenton Hill site. Geophysical logs and cuttings were used to extrapolate between cores. The most abundant rock type is an extremely variable gneissic unit comprising about 75% of the rock penetrated. This rock is strongly foliated and may range compositionally from syenogranitic to tonalitic over a few centimeters. The bulk of the unit falls within the monzogranite field. Interlayered with the gneiss is a ferrohastingsite-biotite schist which compositionally resembles a basaltic andesite. A fault contact between the schist and gneiss was observed in one core. Intrusive into this metamorphic complex are two igneous rocks. A leucocratic monzogranite occurs as at least two 15 m thick dikes, and a biotite granodiorite body was intercepted by 338 m of drill hole. Both rocks are unfoliated and equigranular. The biotite granodiorite is very homogeneous and is characterized by high modal contents of biotite and sphene and by high K_2O , TiO_2 , and P_2O_5 contents. Although all of the cores examined show fractures, most of these are tightly sealed or healed. Calcite is the most abundant fracture-filling mineral, but epidote, quartz, chlorite, clays, or sulfides have also been observed. The degree of alteration of the essential minerals normally increases as these fractures are approached. The homogeneity of the biotite granodiorite at the bottom of GT 2 and the high degree of fracture filling ensure an ideal setting for the Hot Dry Rock Experiment.
