Physicist's Guide to Skepticism Milton A. Rothman, 1988-04 The laws of physics provide clear cut principles defining what is possible and not possible in the physical world This book examines and critiques many widely held pseudoscientific beliefs in light of these laws Rather than treating supernatural claims on a case by case basis Milton Rothman uses the general principles supplied by physics to show why they are in fact impossible Rothman divides the laws of physics into two classes laws of permission and laws of denial Laws of permission such as Newton's laws of motion generally do not allow precise predictions except in the simplest cases Laws of denial such as conservation of energy permit very accurate conclusions about what cannot possibly occur He uses these concepts to examine and critique the possible existence of various paranormal phenomena such as UFOs telepathy perpetual motion machines poltergeists etc He also discusses a number of concepts traditional to science fiction anti gravity faster than light
