and Ergonomics and the Affiliated Conferences Nice France 24 27 July 2024 *The Complete Guide to Walking for Health,
Weight Loss, and Fitness* Mark Fenton, 2007 **Games and Play in HCI** Kathrin Gerling, Ioanna Iacovides, Marc Herrlich, Z.
O. Toups, 2021-08-03 **Neuro-motor control and feed-forward models of locomotion in humans** Marco Iosa, Nadia
Dominici, Federica Tamburella, Leonardo Gizzi, 2015-07-29 Locomotion involves many different muscles and the need of
controlling several degrees of freedom Despite the Central Nervous System can finely control the contraction of individual
muscles emerging evidences indicate that strategies for the reduction of the complexity of movement and for compensating
the sensorimotor delays may be adopted Experimental evidences in animal and lately human model led to the concept of a
central pattern generator CPG which suggests that circuitry within the distal part of CNS i.e spinal cord can generate the
basic locomotor patterns even in the absence of sensory information Different studies pointed out the role of CPG in the
control of locomotion as well as others investigated the neuroplasticity of CPG allowing for gait recovery after spinal cord
lesion Literature was also focused on muscle synergies i.e the combination of locomotor functional modules implemented in
neuronal networks of the spinal cord generating specific motor output by imposing a specific timing structure and
appropriate weightings to muscle activations Despite the great interest that this approach generated in the last years in the
Scientific Community large areas of investigations remain available for further improvement e.g the influence of afferent
feedback and environmental constraints for both experimental and simulated models However also supraspinal structures are
involved during locomotion and it has been shown that they are responsible for initiating and modifying the features of this
basic rhythm for stabilising the upright walking and for coordinating movements in a dynamic changing environment
Furthermore specific damages into spinal and supraspinal structures result in specific alterations of human locomotion as
evident in subjects with brain injuries such as stroke brain trauma or people with cerebral palsy in people with death of
dopaminergic neurons in the substantia nigra due to Parkinson's disease or in subjects with cerebellar dysfunctions such as
patients with ataxia The role of cerebellum during locomotion has been shown to be related to coordination and adaptation of
movements Cerebellum is the structure of CNS where are conceivably located the internal models that are neural
representations miming meaningful aspects of our body such as input output characteristics of sensorimotor system Internal
model control has been shown to be at the basis of motor strategies for compensating delays or lacks in sensorimotor
feedbacks and some aspects of locomotion need predictive internal control especially for improving gait dynamic stability for
avoiding obstacles or when sensory feedback is altered or lacking Furthermore despite internal model concepts are
widespread in neuroscience and neurocognitive science neurorehabilitation paid far too little attention to the potential role of
internal model control on gait recovery Many important scientists have contributed to this Research Topic with original

studies computational studies and review articles focused on neural circuits and internal models involved in the control of human locomotion aiming at understanding the role played in control of locomotion of different neural circuits located at brain cerebellum and spinal cord levels Interoception, Contemplative Practice, and Health Norman Farb, Catherine Kerr, Wolf E. Mehling, Olga Pollatos, 2017-02-07 There is an emergent movement of scientists and scholars working on somatic awareness interoception and embodiment This work cuts across studies of neurophysiology somatic anthropology contemplative practice and mind body medicine Key questions include How is body awareness cultivated What role does interoception play for emotion and cognition in healthy adults and children as well as in different psychopathologies What are the neurophysiological effects of this cultivation in practices such as Yoga mindfulness meditation Tai Chi and other embodied contemplative practices What categories from other traditions might be useful as we explore embodiment Does the cultivation of body awareness within contemplative practice offer a tool for coping with suffering from conditions such as pain addiction and dysregulated emotion This emergent field of research into somatic awareness and associated interoceptive processes however faces many obstacles The principle obstacle lies in our 400 year Cartesian tradition that views sensory perception as epiphenomenal to cognition The segregation of perception and cognition has enabled a broad program of cognitive science research but may have also prevented researchers from developing paradigms for understanding how interoceptive awareness of sensations from inside the body influences cognition The cognitive representation of interoceptive signals may play an active role in facilitating therapeutic transformation e g by altering context in which cognitive appraisals of well being occur This topic has ramifications into disparate research fields What is the role of interoceptive awareness in conscious presence How do we distinguish between adaptive and maladaptive somatic awareness How do we best measure somatic awareness What are the consequences of dysregulated somatic interoceptive awareness on cognition emotion and behavior The complexity of these questions calls for the creative integration of perspectives and findings from related but often disparate research areas including clinical research neuroscience cognitive psychology anthropology religious contemplative studies and philosophy **Neuromodulation of Exercise: Impact on Different Kinds of Behavior** Henning Budde, Bruna Velasques, Pedro Ribeiro, Hideaki Soya, 2021-07-14 **Handbook of Research on Fuzzy and Rough Set Theory in Organizational Decision Making** Sangaiah, Arun Kumar, Gao, Xiao-Zhi, Abraham, Ajith, 2016-10-17 Soft computing techniques are innovative tools that use nature inspired algorithms to run predictive analysis of industries from business to software measurement These tools have gained momentum in recent years for their practicality and flexibility The Handbook of Research on Fuzzy and Rough Set Theory in Organizational Decision Making collects both empirical and applied research in the field of fuzzy set theory and bridges the gap between the application of soft computational approaches and the organizational decision making process This publication is a pivotal reference for business professionals IT specialists software engineers and advanced students of business and information
