Generative AI Ravindra Das,2024-10-10 The cybersecurity landscape is changing for sure For example one of the oldest threat variants is that of phishing It evolved in the early 1990s but even today it is still being used as a primary threat variant and has now become much more sophisticated covert and stealthy in nature For example it can be used to launch ransomware social engineering and extortion attacks The advent of Generative AI is making this much worse For example a cyberattacker can now use something like ChatGPT to craft the content for phishing emails that are so convincing that it is almost impossible to tell the difference between what is real and what is fake This is also clearly evident in the use of deepfakes where fake images of real people are replicated to create videos to lure unsuspecting victims to a fake website But Generative AI can also be used for the good to combat Phishing Attacks This is the topic of this book In this we cover the following A review of phishing A review of AI Neural Networks and Machine Learning A review of Natural Language Processing Generative AI and the Digital Person A proposed solution as to how Generative AI can combat phishing attacks as they relate to Privileged Access accounts

Innovations for a Sustainable Well-Being: Empowering Today's

Youth Dr. D. Ayub Khan Dawood,Dr. Kalyani Kenneth,Dr. Vyjayanthi Mala,Dr. Moon Moon Hussain ,Professor Tasya Aspiranti,Rania Lampou,Dr Hannah John PhD.,2025-02-12 Young people play a vital role in advancing sustainable development climate action and innovation They are not just recipients of change but active stakeholders and catalysts in achieving the Sustainable Development Goals SDGs Despite their immense creativity entrepreneurial mindset and unique talents youth led innovations often lack sufficient resources and recognition Unlocking their potential and harnessing their drive is essential to cultivating future sustainability leaders across different fields In a rapidly evolving world shaped by technological progress shifting global trends and changing socio economic landscapes youth empowerment has become a crucial foundation for building a resilient and prosperous future The concept of sustainable wellbeing among today's youth

has gained significant attention across various sectors. As we look toward the future, it is increasingly evident that fostering the potential and ambitions of young people is not merely an option; it is a necessity for progress and sustainability. Empowering youth is of paramount importance. They are not just passive inheritors of the world we create but the architects of tomorrow's reality. Their creativity, innovation, and fresh perspectives will influence societies, industries, and policies in the years ahead. However, true empowerment goes beyond education; it involves equipping them with the necessary tools, knowledge, skills, and opportunities to take control of their futures and contribute meaningfully to global progress. In fact, this concept extends beyond personal development to broader societal advancement. An empowered youth population fuels economic growth by introducing fresh ideas and entrepreneurial ventures that drive innovation. Additionally, an engaged and informed youth demographic plays a critical role in shaping social and political discourse, ensuring that their concerns and aspirations are reflected in decision-making processes. Nevertheless, the journey toward youth empowerment is complex and multifaceted. It requires addressing key challenges such as equitable access to education, meaningful employment opportunities, mental health support, and the creation of environments that nurture personal growth and confidence. Achieving this goal demands a collective effort from governments, educational institutions, community organizations, and the private sector to build an ecosystem that supports, guides, and uplifts young individuals. Throughout this conference proceeding, we will examine the key aspects of sustainable wellbeing and transformative strategies of youth empowerment. Through this dialogue, we aim to spark ideas, foster meaningful discussions, and emphasize the urgency of investing in today's youth to build a stronger, more resilient future.

Introduction to Artificial Intelligence Tommy P. Trappen, 2024-09-09 playing poorly but learned to play better by playing many games against itself Growing to play better than Samuel this program disproved the still made argument that computers can only do what they are told to do A particularly good example of how a simple set of rules can produce seemingly complex behavior was Joseph Weizenbaum's Eliza program which simulates a Rogerian psychotherapist Although Eliza's algorithms are best described as simple pattern matching and it was not intended as a serious attempt at

machine intelligence it still produced appropriate responses to a variety of statements Because of programs like Eliza there was also a hope of building systems in the near future that would pass the Turing Test for machine intelligence In the Turing Test a human judge sits at a computer terminal and chats via instant messenger with one of two entities either a human or an AI computer program The human and computer would each try to convince the human judge that they are the human If the judge is unable tell whether she is chatting with a human or the AI program then the AI program passes the Turing Test Turing considered this a sufficient but not necessary condition for intelligence since a machine could be intelligent without being able to impersonate a human Things seemed very rosy Herb Simon in 1957 said It is not my aim to surprise or shock you but the simplest way I can summarize is to say that there are now in the world machines that think that learn and that create Moreover their ability to do these things is going to increase rapidly until in a visible future the range of problems they can handle will be coextensive with the range to which human mind has been applied More precisely within 10 years a computer would be chess champion and an important new mathematical theorem would be proved by a computer Both of these milestones have now been achieved by computers but each took closer to 40 years rather than 10 After the initial enthusiasm there was the dawning realization that problems are much harder than one originally thought and that simple tricks dont work For instance one of Elizas rules was that if the user utters the word mother then respond Tell me more about your family This sometimes works well but it can also generate some very unnatural responses For example if you say I wanted to adopt a puppy but its too young to be separated from its mother Eliza may also respond Tell me more about your family Another example was machine translation Much time and money were spent following Sputnik s launch in 1957 on developing systems to automatically translate Russian documents into English This turned out to be a very hard problem since much specialized knowledge seems to be required to understand language A famous example The spirit is willing but the flesh is weak was translated into Russian and then retranslated back into English giving 1 2 Approaches to AI 3 The vodka is strong but the meat is rotten At that point people realized two things that made the AI problem much harder than they had originally thought 1 In order to do a good job in any realistic task simple syntactic manipulation i e simple rules to shuffle words around or do Russian to English dictionary lookups is not good enough Instead we must have enough knowledge about the world to really understand what s being said so as to reason more deeply about it For example in the translation example we need to understand that spirit refers to the metaphorical or mystical human spirit rather than to alcohol 2 Computational intractability The AI goal was defined before the theory of NP completeness was developed At that point people thought that to deal with larger problems we need only larger faster computers In particular the phenomena of exponential scaling in which the computation scales exponentially with the size of the problem was not yet understood Many early AI methods required solving NP hard problems and therefore did not scale well to larger problems
