GPU Parallel Program Development Using CUDA Tolga Soyata, 2018-01-19 GPU Parallel Program Development using CUDA teaches GPU programming by showing the differences among different families of GPUs This approach prepares the reader for the next generation and future generations of GPUs The book emphasizes concepts that will remain relevant for a long time rather than concepts that are platform specific At the same time the book also provides platform dependent explanations that are as valuable as generalized GPU concepts The book consists of three separate parts it starts by explaining parallelism using CPU multi threading in Part I A few simple programs are used to demonstrate the concept of dividing a large task into multiple parallel sub tasks and mapping them to CPU threads Multiple ways of parallelizing the same task are analyzed and their pros cons are studied in terms of both core and memory operation Part II of the book introduces GPU massive parallelism The same programs are parallelized on multiple Nvidia GPU platforms and the same performance analysis is repeated Because the core and memory structures of CPUs and GPUs are different the results differ in interesting ways The end goal is to make programmers aware of all the good ideas as well as the bad ideas so readers can apply the good ideas and avoid the bad ideas in their own programs Part III of the book provides pointer for readers who want to expand their horizons It provides a brief introduction to popular CUDA libraries such as cuBLAS cuFFT NPP and Thrust the OpenCL programming language an overview of GPU programming using other programming languages and API libraries such as Python OpenCV OpenGL and Apple s Swift and Metal and the deep learning library cuDNN

System-Level Design of GPU-Based Embedded Systems Arian

Maghazeh,2018-12-07 Modern embedded systems deploy several hardware accelerators in a heterogeneous manner to deliver high performance computing Among such devices graphics processing units GPUs have earned a prominent position by virtue of their immense computing power However a system design that relies on sheer throughput of GPUs is often incapable of satisfying the strict power and time related constraints faced by the embedded systems This thesis presents several system level software techniques to optimize the design of GPU based embedded systems under various graphics and non graphics applications As compared to the conventional application level optimizations the system wide view of our proposed techniques brings about several advantages First it allows for fully incorporating the limitations and requirements of the various system parts in the design process Second it can unveil optimization opportunities through exposing the information flow between the processing components Third the techniques are generally applicable to a wide range of applications with similar characteristics In addition multiple system level techniques can be combined together or with application level techniques to further improve the performance We begin by studying some of the unique attributes of GPU based embedded systems and discussing several factors that distinguish the design of these systems from that of the conventional high end GPU based systems We then proceed to develop two techniques that address an important challenge in the design of GPU based embedded systems from different perspectives The challenge arises from the fact that GPUs

require a large amount of workload to be present at runtime in order to deliver a high throughput. However, for some embedded applications, collecting large batches of input data requires an unacceptable waiting time, prompting a trade off between throughput and latency. We also develop an optimization technique for GPU based applications to address the memory bottleneck issue by utilizing the GPU L2 cache to shorten data access time. Moreover, in the area of graphics applications and in particular with a focus on mobile games, we propose a power management scheme to reduce the GPU power consumption by dynamically adjusting the display resolution while considering the user's visual perception at various resolutions. We also discuss the collective impact of the proposed techniques in tackling the design challenges of emerging complex systems. The proposed techniques are assessed by real life experimentations on GPU based hardware platforms which demonstrate the superior performance of our approaches as compared to the state of the art techniques.
