Perspectives On Organisms Biological Time Symmetries And Singularities Lecture Notes In Morphogenesis:

Perspectives on Organisms Giuseppe Longo, Maël Montévil, 2013-12-13 This authored monograph introduces a genuinely theoretical approach to biology Starting point is the investigation of empirical biological scaling including their variability which is found in the literature e g allometric relationships fractals etc The book then analyzes two different aspects of biological time first a supplementary temporal dimension to accommodate proper biological rhythms secondly the concepts of protension and retention as a means of local organization of time in living organisms Moreover the book investigates the role of symmetry in biology in view of its ubiquitous importance in physics In relation with the notion of extended critical transitions the book proposes that organisms and their evolution can be characterized by continued symmetry changes which accounts for the irreducibility of their historicity and variability The authors also introduce the concept of anti entropy as a measure for the potential of variability being equally understood as alterations in symmetry By this the book provides a mathematical account of Gould s analysis of phenotypic complexity with respect to biological evolution The target audience primarily comprises researchers interested in new theoretical approaches to biology from physical biological or philosophical backgrounds but the book may also be beneficial for graduate students who want to enter this field *John Dewey and Confucian Thought* Jim Behuniak, 2019-07-24 Assesses John Dewey s visit to China in 1919 21 as an intra cultural episode and promotes Chinese natural philosophy as a philosophical context in which to understand the connections between Dewey s philosophy and early Confucian thinking In this conclusion to his two volume series Jim Behuniak builds upon the groundbreaking work begun in *John Dewey and Daoist Thought* in arguing that Chinese natural philosophy is the proper hermeneutical context in which to understand early Confucianism First he traces Dewey s late period cultural turn in more detail and then proceeds to assess Dewey s visit to China in 1919 21 as a multifaceted intra cultural episode one that includes not only what Dewey taught his Chinese audiences but also what he learned in China and what we stand to learn from this encounter today Dewey in China provides an opportunity to continue establishing specific philosophical relationships between Dewey and Confucian thought for the purpose of getting ourselves back in gear with contemporary thinking in the social and natural sciences To this end Behuniak critically assesses readings of early Chinese thought reliant on outdated Greek medieval assumptions paying particular attention to readings of early Confucianism that rely heavily on Western virtue ethics such as the Heaven s plan reading Topics covered include education tradition ethics the family human nature and religiousness thus engaging Dewey with themes generally associated with Confucian thought Attacking the distinction of Eastern versus Western philosophical cultures these volumes create a detailed intra cultural Deweyan Chinese thought on many levels at once Using Dewey to reinterpret the Daoist and Confucian traditions from their sources Behuniak weaves an intra cultural philosophical trajectory that stretches from the sixth century BCE China to Columbia University in New York City The result is one of the philosophical masterpieces of our time Robert Cummings Neville Professor Emeritus

Wealth is no longer just an ability to live well in a world shaped by human activities It is also an ability to push back or defer the limits of a world in biological and climatic closure This book examines the theoretical conflicts and the power plays which often oppose the socio political and technical financial practices of recognition of what intervenes in the production of this wealth i e of what has value It lays down the principles of a contributory modeling method allowing debates around the concept of development the building of scenarios the negotiation of their implementation and a cross sectoral reading of their social ecological and economic costs This method called Dynamic Modeling of Cost Systems is based on a territorial communication device which articulates political contractual and accounting innovations using deliberative and normative digital tools It combines different local representations of value in order to approach wealth through an integrated analysis of micro meso and macro issues **Figures of Chance II** Anne Duprat, Alison James, 2024-07-31 Figures of Chance II Chance in Theory and Practice proposes a multidisciplinary analysis of cultural phenomena related to notions of chance and contingency Alongside its transhistorical companion volume Figures of Chance I it considers how the projective and predictive capacity of societies is shaped by representations and cultural models of a reality that is understood by varying degrees to be contingent unpredictable or chaotic This volume reevaluates the role played by figurative representations of chance in contemporary discourses about chance and contingency Written by seven interdisciplinary teams and encompassing philosophy literature history of science sociology mathematics cognitive science information science and art history this text puts scientific conceptions of chance into dialogue with their contemporary literary and artistic representations It thus brings out the central role played by art in the human perception of chance and in our methods for projecting the future in order to better understand contemporary human attitudes in the face of risk A World Beyond Physics Stuart A. Kauffman, 2019-04-01 How did life start Is the evolution of life describable by any physics like laws Stuart Kauffman s latest book offers an explanation beyond what the laws of physics can explain of the progression from a complex chemical environment to molecular reproduction metabolism and to early protocells and further evolution to what we recognize as life Among the estimated one hundred billion solar systems in the known universe evolving life is surely abundant That evolution is a process of becoming in each case Since Newton we have turned to physics to assess reality But physics alone cannot tell us where we came from how we arrived and why our world has evolved past the point of unicellular organisms to an extremely complex biosphere Building on concepts from his work as a complex systems researcher at the Santa Fe Institute Kauffman focuses in particular on the idea of cells constructing themselves and introduces concepts such as constraint closure Living systems are defined by the concept of organization which has not been focused on in enough in previous works Cells are autopoietic systems that build themselves they literally construct their own constraints on the release of energy into a few degrees of freedom that constitutes the very thermodynamic work by which they build their own

self creating constraints Living cells are machines that construct and assemble their own working parts The emergence of such systems the origin of life problem was probably a spontaneous phase transition to self reproduction in complex enough prebiotic systems The resulting protocells were capable of Darwin s heritable variation hence open ended evolution by natural selection Evolution propagates this burgeoning organization Evolving living creatures by existing create new niches into which yet further new creatures can emerge If life is abundant in the universe this self constructing propagating exploding diversity takes us beyond physics to biospheres everywhere
