Multistage Hydraulic Fracturing Treatment for Maximization of the Tight Gas Productivity Mengting Li,2018-12-17

Hydraulic fracturing is essential technology for the development of unconventional resources such as tight gas So far there

are no numerical tools which can optimize the whole process from geological modeling hydraulic fracturing until production

simulation with the same 3D model with consideration of the thermo hydro mechanical coupling In this dissertation a

workflow and a numerical tool chain were developed for design and optimization of multistage hydraulic fracturing in

horizontal well regarding a maximum productivity of the tight gas wellbore After the verification a full 3D reservoir model is

generated based on a real tight gas field in the North German Basin Through analysis of simulation results a new calculation

formula of FCD was proposed which takes the proppant position and concentration into account and can predict the gas

production rate more accurately However not only FCD but also proppant distribution and hydraulic connection of stimulated

fractures to the well geological structure and the interaction between fractures are determinant for the gas production

volume Through analysis the numerical results of sensitivity analysis and optimization variations there is no unique criterion

to determine the optimal number and spacing of the fractures it should be analyzed firstly in detail to the actual situation and
