Civil Liability for Artificial Intelligence and Software Mark A. Geistfeld, Ernst Karner, Bernhard A. Koch, Christiane Wendehorst, 2022-11-21 Initiated by the European Commission the first study published in this volume analyses the largely unresolved question as to how damage caused by artificial intelligence AI systems is allocated by the rules of tortious liability currently in force in the Member States of the European Union and in the United States to examine whether and if so to what extent national tort law regimes differ in that respect and to identify possible gaps in the protection of injured parties The second study offers guiding principles for safety and liability with regard to software testing how the existing *acquis* needs to be adjusted in order to adequately cope with the risks posed by software and AI The annex contains the final report of the New Technologies Formation of the Expert Group on Liability and New Technologies assessing the extent to which existing liability schemes are adapted to the emerging market realities following the development of new digital technologies

Data Mining and Exploration Chong Ho Alex Yu, 2022-10-27 This book introduces both conceptual and procedural aspects of cutting edge data science methods such as dynamic data visualization artificial neural networks ensemble methods and text mining There are at least two unique elements that can set the book apart from its rivals First most students in social sciences engineering and business took at least one class in introductory statistics before learning data science However usually these courses do not discuss the similarities and differences between traditional statistics and modern data science as a result learners are disoriented by this seemingly drastic paradigm shift In reaction some traditionalists reject data science altogether while some beginning data analysts employ data mining tools as a black box without a comprehensive view of the foundational differences between traditional and modern methods e g dichotomous thinking vs pattern recognition confirmation vs exploration single method vs triangulation single sample vs cross validation etc This book delineates the transition between classical methods and data science e g from p value to Log Worth from resampling to ensemble methods from content analysis to text mining etc Second this book aims to widen the learner's horizon by covering a plethora of software tools When a technician has a hammer every problem seems to be a nail By the same token many textbooks focus on a single software package only and consequently the learner tends to fit the problem with the tool but not the other way around To rectify the situation a competent analyst should be equipped with a tool set rather than a single tool For example when the analyst works with crucial data in a highly regulated industry such as pharmaceutical and banking commercial software modules e g SAS are indispensable For a mid size and small company open source packages such as Python would come in handy If the research goal is to create an executive summary quickly the logical choice is rapid model comparison If the analyst would like to explore the data by asking what if questions then dynamic graphing in JMP Pro is a better option This book uses concrete examples to explain the pros and cons of various software applications
