Oxidative Stress And Vascular Disease Developments In Cardiovascular Medicine:

Oxidative Stress and Vascular Disease John F. Keaney Jr., 2012-12-06 One of the major biomedical triumphs of the post World War II era was the definitive demonstration that hypercholesterolemia is a key causative factor in atherosclerosis that hypercholesterolemia can be effectively treated and that treatment significantly reduces not only coronary disease mortality but also all cause mortality Treatment to lower plasma levels of cholesterol primarily low density lipoprotein LDL cholesterol is now accepted as best medical practice and both physicians and patients are being educated to take aggressive measures to lower LDL We can confidently look forward to important decreases in the toll of coronary artery disease over the coming decades However there is still uncertainty as to the exact mechanisms by which elevated plasma cholesterol and LDL levels initiate and favor the progression of lesions There is general consensus that one of the earliest responses to hypercholesterolemia is the adhesion of monocytes to aortic endothelial cells followed by their penetration into the subendothelial space where they differentiate into macrophages These cells and also medial smooth muscle cells that have migrated into the subendothelial space then become loaded with multiple large droplets of cholesterol esters the hallmark of the earliest visible atherosclerotic lesion the so called fatty streak This lesion is the precursor of the more advanced lesions both in animal models and in humans Thus the centrality of hypercholesterolemia cannot be overstated Still the atherogenic process is complex and evolves over a long period of time

Studies on Atherosclerosis Martin Rodriguez-Porcel, Alejandro R. Chade, Jordan D. Miller, 2016-12-22 This volume explores the role free radicals and antioxidants within the development of vascular disease examining fundamental research and translating preclinical knowledge to clinical trials The expertly authored chapters describe the relationship of oxidative stress to atherosclerosis and the cardiovascular system exploring its role in cardiac fibrosis renovascular disease hypertension and regulation of blood pressure and cerebral vascular tone The concluding chapter discusses the current state of clinical research contextualizing clinical trials within the existing theoretical framework and analyzing attempts to preserve oxidant stress under various conditions With its concise and authoritative analysis of pre clinical research and clinical results Studies in Atherosclerosis

Diabetes Augmentation on Vascular Disease, volume II Godfrey Getz ,Catherine A Reardon,2025-07-31 This Research Topic is the second volume of the Diabetes Augmentation on Vascular Disease Please see the first volume here It is widely recognized that cardiovascular disease is the major morbidity associated with type 2 diabetes Although the mechanisms contributing to this increased morbidity are poorly understood it is clear that this is attributable in part to the worsening of the risk factors that contribute to the enhancement of the vascular inflammation and atherosclerosis that contribute to coronary artery disease stroke and peripheral vascular disease This includes obesity dyslipidemia oxidative stress and inflammation Recent studies in humans and experimental animal models highlight inflammation as a critical element of atherosclerosis and its consequent impact on cardiovascular disease Inflammation will be a theme that underlies many of the interactions between diabetes and cardiovascular disease reviewed in this Research Topic This review series will also address clinical correlations between diabetes and clinical cardiovascular disease and attempts to reduce the risk the effect of diabetes on macrophages and the production of monocyte macrophages to promotes atherosclerosis autoimmunity in diabetes and the effect of diabetes on the heart and kidneys contributing to cardiovascular disease Moreover each article will emphasize how these risk factor in diabetes augment cardiovascular disease and focus on future issues to be addressed
