Network Simulation Hemant Bhanoo,2002 Abstract NS 21 a popular network simulator which formed our simulation environment has support for modeling many of the characteristics of networks including node properties packet forwarding routing protocols and transport and link level protocols However a crucial part of investigating the behavior of these components is to be able to provide them with an appropriate workload To do this measurements are taken on a real network and this data used to control the traffic characteristics of the simulation We would like to investigate the feasibility of accurately simulating the traffic of a particular network being able to do so opens up the possibility of answering operations level questions such as what would happen if I moved this server farm from behind router A to behind

router B We attacked this problem by choosing to simulate two common types of traffic Our sic results show that a significant error was introduced due to the fact that we only modeled a small proportion of the observed traffic However sic we show that after accounting for this the simulations were able to capture 5 minute average bandwidth quite well This motivates future work on creating tunable traffic generators for other popular application traffic Doing so would allow us to focus on capturing smaller time scale second sub second properties of a given network
