Handbook of Constraint Programming Francesca Rossi,Peter van Beek,Toby

Walsh,2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates

and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

Principles and Practice of Constraint Programming - CP 2006 Frédéric Benhamou, 2006-09-26 This book constitutes the refereed proceedings of the 12th International Conference on Principles and Practice of Constraint Programming CP 2006 held in Nantes France in September 2006 The 42 revised full papers and 21 revised short papers presented together with extended abstracts of four invited talks were carefully reviewed and selected from 142 submissions All current issues of computing with constraints are addressed

Theory and Applications of Satisfiability Testing - SAT 2009 Oliver Kullmann, 2009-06-29 This volume contains the papers presented at SAT 2009 12th International Conference on Theory and Applications of Satisfiability Testing held from June 30 to July 3 2009 in Swansea UK The International Conference on Theory and Applications of Satisfiability Testing SAT started in 1996 as a series of workshops and in parallel with the growth of SAT developed into the main event for SAT research This year conference testified to the strong interest in SAT regarding theoretical research search algorithms investigations into applications and development of solvers and software systems As a core problem of computer science SAT is central for many research areas and has deep interactions with many mathematical subjects Major impulses for the development of SAT came from concrete practical applications as well as from fundamental theoretical research This fruitful collaboration can be seen in virtually all papers of this volume There were 86

submissions completed papers within the scope of the conference Each submission was reviewed by at least three and on average 4.0 Programme Committee members The Committee decided to accept 45 papers consisting of 34 regular and 11 short papers restricted to 6 pages A main novelty was a shepherding process where 29% of the papers were accepted only conditionally and requirements on necessary improvements were formulated by the Programme Committee and its installment monitored by the shepherd for that paper using possibly several rounds of feedback

Sat2000 Ian Gent,Hans van Maaren,Toby Walsh,2000 The book is devoted to various disciplines in satisfiability research and aims to give the reader an impression of the state of the art of this research in the year 2000 It consists of a compilation of articles on this subject which have appeared or will appear in the periodicals The disciplines covered fall not entirely neatly into four categories complete methods stochastic methods applications and extensions beyond propositional SAT

Handbook of Satisfiability Armin Biere,Hans van Maaren,Toby Walsh,2021-05-15 Propositional logic has been recognized throughout the centuries as one of the cornerstones of reasoning in philosophy and mathematics Over time its formalization into Boolean algebra was accompanied by the recognition that a wide range of combinatorial problems can be expressed as propositional satisfiability SAT problems Because of this dual role SAT developed into a mature multi faceted scientific discipline and from the earliest days of computing a search was underway to discover how to solve SAT problems in an automated fashion This book the Handbook of Satisfiability is the second updated and revised edition of the book first published in 2009 under the same name The handbook aims to capture the full breadth and depth of SAT and to bring together significant progress and advances in automated solving Topics covered span practical and theoretical research on SAT and its applications and include search algorithms heuristics analysis of algorithms hard instances randomized formulae problem encodings industrial applications solvers simplifiers tools case studies and empirical results SAT is interpreted in a broad sense so as well as propositional satisfiability there are chapters covering the domain of quantified Boolean formulae QBF constraints programming techniques CSP for word level problems and their propositional encoding and satisfiability modulo theories SMT An extensive bibliography completes each chapter This second edition of the handbook will be of interest to researchers graduate students final year undergraduates and practitioners using or contributing to SAT and will provide both an inspiration and a rich resource for their work Edmund Clarke 2007 ACM Turing Award Recipient SAT solving is a key technology for 21st century computer science Donald Knuth 1974 ACM Turing Award Recipient SAT is evidently a killer app because it is key to the solution of so many other problems Stephen Cook 1982 ACM Turing Award Recipient The SAT problem is at the core of arguably the most fundamental question in computer science What makes a problem hard
