Mobile IP Skyler Lewis & Brett Anderson, 2018-04-26 *Mobile IP* is most often found in wired and wireless environments where users need to carry their mobile devices across multiple LAN subnets Examples of use are in roaming between overlapping wireless systems e.g

IP over DVB WLAN WiMAX and BWA Mobile IP is not required within cellular systems such as 3G to provide transparency when Internet users migrate between cellular towers since these systems provide their own data link layer handover and roaming mechanisms. However, it is often used in 3G systems to allow seamless IP mobility between different packet data serving node PDSN domains. Mobile IP is an Internet Engineering Task Force (IETF) standard communications protocol that is designed to allow mobile device users to move from one network to another while maintaining their permanent IP address. Defined in Request for Comments RFC 2002, Mobile IP is an enhancement of the Internet Protocol IP that adds mechanisms for forwarding Internet traffic to mobile devices known as mobile nodes when they are connecting through other than their home network. Mobile IP communication protocol refers to the forwarding of Internet traffic with a fixed IP address even outside the home network. It allows users having wireless or mobile devices to use the Internet remotely. Mobile IP is mostly used in WAN networks where users need to carry their mobile devices across different LANs with different IP addresses. Mobile IP is not a wireless protocol. However, it could be employed for the IP infrastructure of cellular networks. The principle objective of this book is to provide an introduction to basic concepts and methodologies for mobile communication and to develop a foundation that can be used as the basis for further study and research in the field of communication engineering.
