Using Additional Information in Streaming Algorithms Raffael Buff, 2016-10-04 Streaming problems are algorithmic problems that are mainly characterized by their massive input streams Because of these data streams the algorithms for these problems are forced to be space efficient as the input stream length generally exceeds the available storage In this thesis the two streaming problems most frequent item and number of distinct items are studied in detail relating to their algorithmic complexities and it is compared whether the verification of solution hypotheses has lower algorithmic complexity than computing a solution from the data stream For this analysis we introduce some concepts to prove space complexity lower bounds for an approximative setting and for hypothesis verification For the most frequent item problem which consists in identifying the item which has the highest occurrence within the data stream we can prove a linear space complexity lower bound for the deterministic and probabilistic setting This implies that in practice this streaming problem cannot be solved in a satisfactory way since every algorithm has to exceed any reasonable storage limit For some settings the upper and lower bounds are almost tight which implies that we have designed an almost optimal algorithm Even for small approximation ratios we can prove a linear lower bound but not for larger ones Nevertheless we are not able to design an algorithm that solves the most frequent item problem space efficiently for large approximation ratios Furthermore if we want to verify whether a hypothesis of the highest frequency count is true or not we get exactly the same space complexity lower bounds which leads to the conclusion that we are likely not able to profit from a stated hypothesis The number of distinct items problem counts all different elements of the input stream If we want to solve this problem exactly in a deterministic or probabilistic setting or approximately with a deterministic algorithm we require once again linear storage size which is tight to the upper bound However for the approximative and probabilistic setting we can enhance an already known space efficient algorithm such that it is usable for arbitrarily small approximation ratios and arbitrarily good success probabilities The hypothesis verification leads once again to the same lower bounds However there are some streaming problems that are able to profit from additional information such as hypotheses as e g the median problem
