Penicillium And Acremonium Penicillium And Acremonium:

Penicillium and Acremonium John F. Peberdy, 2013-11-11 Biotechnology is a word that was originally coined to describe the new processes which could be derived from our ability to manipulate in vitro the genetic material common to all organisms. It has now become a generic term encompassing all applications of living systems including the more traditional fermentation and agricultural industries. Recombinant DNA technology has opened up new opportunities for the exploitation of microorganisms and animal and plant cells as producers or modifiers of chemical and biological products. This series of handbooks deals exclusively with microorganisms which are at the forefront of the new technologies and brings together in each of its volumes the background information necessary to appreciate the historical development of the organisms making up a particular genus, the degree to which molecular biology has opened up new opportunities and the place they occupy in today's biotechnology industry. Our aim was to make this primarily a practical approach with emphasis on methodology combining for the first time information which has largely been spread across a wide literature base or only touched upon briefly in review articles. Each handbook should provide the reader with a source text from which the importance of the genus to his or her work can be identified and a practical guide to the handling and exploitation of the organisms included.

Structure and Functioning of Seminatural Meadows Milena Rychnovská, 1993 *Enzymes in the Environment* Richard G. Burns, Richard P. Dick, 2002-01-29 The need to understand the biological processes that are important for essential aquatic and terrestrial ecosystem function has prompted much research into the field of ecological enzymology. This book presents the two broad areas of application in a compilation of reviews by 21 international experts in their respective fields. The first explores enzymatic activities to assess the processes or mechanisms that operate in a given system such as the rhizosphere, plant leaves and shoots, soil surfaces and biofilms. The second considers enzymes or microbial cells as sensors to detect microbial activity and stresses due to pollution management or climatic change in both aquatic and terrestrial ecosystems.

Marine Microbiome and Microbial Bioprospecting Manikkam Radhakrishnan, Parli Venkateswaran Bhaskar, Abirami Baskaran, Kaari Manigundan, 2025-10-01 Marine Microbiome and Microbial Bioprospecting. Diversity and Bioactive Potential comprehensively discusses the diversity of microbes present in various marine ecosystems, their bioprospecting potential and how they can be utilized to derive bioproducts that benefit different fields and industries. Sections overview marine microbes, their ex situ conservation and the tools and techniques used to study marine microbial diversity and taxonomy. In addition, it explores and details microorganisms in different marine ecosystems and considers how bioactive metabolites from diverse marine microorganisms can be harnessed to combat pathogens used in industrial products and in environmental remediation and degradation and enhanced for agricultural and aquaculture applications. With contributions from experts in the field, this book aims to be a valuable resource for researchers and industry professionals in microbiology and biotechnology and anyone involved in finding lead molecules from marine microbial resources for wide ranging applications. Discusses existing
