Periodic Nanostructures Developments In Fullerene Science:

Nanostructures Mircea V. Diudea, 2005 Novel carbon allotropes such as spherical fullerenes and nanotubes have been added in the last three decades to the traditionally recognised diamond and graphite Although fullerene C₆₀ has been speculated about for a long time A fullerene is according to a classical definition an all carbon molecule consisting entirely of pentagons exactly 12 and hexagons $n \geq 10$ Non classical fullerene extensions to include rings of other sizes have been considered Fullerenes are commonly synthesised by arc discharge or laser ablation methods Spherical fullerenes became nowadays parts of real chemistry they can be functionalised or inserted in supramolecular assemblies *Periodic*

Nanostructures Mircea V. Diudea, Csaba L. Nagy, 2007-08-23 These tiny structures could offer architectural designs for the cities of the future The authors explore the foam like carbon structures which relate to schwarzites and which are infinite periodic minimal surfaces of negative curvature They show that the periodicity of close repeat units of such structures is evident not only in these formations but also in all of the carbon allotropes The text provides literature and data on the field of nanostructure periodicity and the authors own results on nanostructure building and energy calculations *Handbook of Fullerene Science and Technology* Xing Lu, Takeshi Akasaka, Zdeněk Slanina, 2022-09-24 Nanocarbon chemistry and physics is a fast developing broad research area the Nobel prizes in 1996 and 2010 awarded to two key discoveries in the field and several other nanocarbon achievements of comparable importance Owing to this rapid growth the nanocarbon landscape fundamentally changes every few years creating a need to survey the field on a regular basis to update the books that have become incomplete or even obsolete As such this book focuses on fullerenes and metallofullerenes and also on the related areas of nanotubes and graphenes All the covered research topics provide important fundamental knowledge for the natural sciences but also for applications in molecular electronics superconductivity catalysis photovoltaics and medical diagnostics The current nanocarbon research activities have particularly high application potential in the conversion of solar energy future molecular memories non conventional materials for optoelectronics and new treatments for civilization diseases Offering a truly up to date critical survey of nanocarbon science its concepts and highlights it follows the concept of a handbook it addresses key topics systematically from historical background methodological aspects current important issues and application potential all supplied with extensive referencing With individual chapters written by leading experts with extensive research experience it is a comprehensive reference resource for graduate students and active researchers alike

Manzano-Agugliaro, Aránzazu Fernández-García, 2020-02-05 Environmental problems derived from the massive use of conventional energy resources are one of the main issues that our society has been facing in recent decades. Renewable energies and particularly solar energy have become a highly competitive means to meet the world's increasing energy demands in a sustainable and clean manner. One of the key research challenges for the commercial deployment of several solar energy technologies is focused on the development of feasible and durable coatings that withstand appropriate optical and thermal performance over the lifetime of the solar facilities. This book addresses a number of relevant aspects related to coatings for renewable energies including a deep survey of coatings used in photovoltaic solar energy, the development of a superhydrophobic and thermal stable silica coating that is potentially suitable for various industrial applications related to renewable technologies, the development of coatings to improve the resistance of structural materials used in concentrating solar thermal technologies with molten salts and several research works related to solar reflectors for concentrating solar thermal technologies such as the advanced analysis of the corrosion, the suitability of anti-soiling coatings and the development of top protective coatings for high temperature secondary concentrators. **Coatings to Improve**

Optoelectronic Devices Selected Articles Published by MDPI, 2020-04-09 This selection is focused on coatings and films with applications in optoelectronics such as photovoltaics, photocatalysis and light-based sensors and phenomena. The studies investigate the optimal composition, crystalline structure and morphology to deliver the different functionalities sought. Obtaining transparent p-type electrodes is challenging but extremely relevant in optoelectronics. Electric conduction mechanisms and the correlations with structure and doping are discussed. The important issue of the degradation pathways in perovskite-based solar cells and the possibilities offered by different types of coatings to encapsulate the devices as well as the beneficial effect of silica coating as an antireflection and antisoiling layer on well-established solar cells are discussed. New designs of nanoplasmonic films for chemical and biological molecule sensing are reviewed such as the combination of metallic nanoparticles and nanostructured semiconductors and dispersing metallic or bi-metallic nanoparticles in CuO films. The impacts of structure defects and morphology on the photoactivated properties of WO₃ films and on the shape memory behavior in Cu-Al-Ni thin films are discussed. Aggregated TiO₂ nanoparticles on TiO₂ layers are shown to enhance optical transmittance and confer a superhydrophilic characteristic. Finally, aspects of the fundamental characterization of thin films, Drude damping in thin films and laser-induced deflection technique are discussed. Nanomaterials in Clinical Therapeutics
