Association Between Viral Infection and Human Cancers Ming Hu, Jinlin Li, Bin Wang, Chengjun Wu, 2024-02-13 Research on the mechanisms of viral transformation and oncogenesis has laid the foundation for our current understanding of certain cancers. For instance, some oncogenes are activated or taken over by retroviruses, and some viral proteins impair tumor suppressor gene functions. Particular viruses from multiple virus families as well as unusual or unclassified viruses have been implicated in causing cancers through natural occurrence or experimentation on animals. It is believed that 15% to 20% of all human cancer cases are linked to infections by one of seven viruses: Epstein Barr virus, hepatitis B virus, hepatitis C virus, human herpesvirus 8, human T cell lymphotropic virus type 1, human papillomaviruses, and Merkel cell polyomavirus.
