Advances in Brain Tumor Therapy Tanmay Abhay Kulkarni, Ramcharan Singh Angom, Joubert Banjop Kharlyngdoh, 2025-08-19 Brain tumors a diverse group of neoplasms

originating from abnormal cell growth within the brain or its surrounding structures present complex diagnostic and therapeutic challenges. The diagnosis and treatment of brain tumors require a multidisciplinary approach incorporating advanced imaging techniques, histopathology, molecular profiling, and innovative therapeutic interventions. Diagnostic imaging techniques such as magnetic resonance imaging (MRI), computed tomography (CT), and positron emission tomography (PET) play a prominent role in assessing the tumor's location, size, and characteristics. Advanced imaging methods such as functional MRI (fMRI) and diffusion tensor imaging (DTI) aid in identifying critical areas of the brain affected by the tumor and facilitating surgical planning. Histopathology, immunohistochemistry, molecular testing, and genetic profiling have become integral to identifying specific molecular alterations that guide treatment decisions and predict the tumor's behavior and response to therapies. Additionally, gaining more information regarding novel concepts such as utilization of stem cells in prognosis, advancement in the novel therapeutic options, and mediation of intra-cellular signaling and metabolism related to tumor growth will lead to novel treatments. Integration of metabolic module along with molecular and morphological features could allow a deeper understanding of brain tumors and drive the pursuit of identification of emerging effective therapy options. With this Research Topic, we hope to consolidate novel diagnostic techniques as well as emerging therapeutic options together, which could lead to the development of a robust, practical, and innovative take on life-saving diagnostic and therapeutic options for individuals with brain tumors.
