Technological Breakthroughs and Future Business Opportunities in Education, Health, and Outer Space Hooke, Angus, 2021-04-09. It is widely accepted that the key to rising incomes for workers, for investors, and indirectly for welfare recipients is innovation. New ideas provide opportunities for investment in new products, new processes, and new markets. Exploitation of these opportunities by intrapreneurs and entrepreneurs gives rise to increases in labor productivity, which in turn lead to higher primary incomes for workers and investors, and via government redistributive mechanisms, larger transfers to welfare recipients. Since technology is the driver of innovation and the key to the subsequent economic and distributional benefits of this innovation, there is a need for researchers and businesspersons to have access to up-to-date information on emerging technologies and the business opportunities they provide. Technological Breakthroughs and Future Business Opportunities in Education, Health, and Outer Space discusses the economic, social, and cultural benefits that new technologies can provide in multidisciplinary industries, with a unique emphasis on looking towards the impacts of these technologies across the next two decades. Within this theme, the book discusses the recent trends, future developments, and business opportunities surrounding new technologies, including information technology and biotechnology. Additionally, the book investigates recent demands and disruptions in the health and education sectors, as well as recent developments and forthcoming opportunities in the outer space sector, and how newer technologies can enable and meet the growing demands of these industries. While covering all these technologies and their applications, this book is an ideal reference work for entrepreneurs, intrapreneurs, teachers, technologists, analysts, IT specialists, engineers, policymakers, medical professionals, government officials, space agencies, financial planners, public officials, and researchers and students working in areas that include but are not limited to

System-Level Design of GPU-Based Embedded Systems Arian Maghazeh, 2018-12-07 Modern embedded systems deploy several hardware accelerators in a heterogeneous manner to deliver high performance computing Among such devices graphics processing units GPUs have earned a prominent position by virtue of their immense computing power However a system design that relies on sheer throughput of GPUs is often incapable of satisfying the strict power and time related constraints faced by the embedded systems This thesis presents several system level software techniques to

optimize the design of GPU based embedded systems under various graphics and non graphics applications As compared to the conventional application level optimizations the system wide view of our proposed techniques brings about several advantages First it allows for fully incorporating the limitations and requirements of the various system parts in the design process Second it can unveil optimization opportunities through exposing the information flow between the processing components Third the techniques are generally applicable to a wide range of applications with similar characteristics In addition multiple system level techniques can be combined together or with application level techniques to further improve the performance We begin by studying some of the unique attributes of GPU based embedded systems and discussing several factors that distinguish the design of these systems from that of the conventional high end GPU based systems We then proceed to develop two techniques that address an important challenge in the design of GPU based embedded systems from different perspectives The challenge arises from the fact that GPUs require a large amount of workload to be present at runtime in order to deliver a high throughput However for some embedded applications collecting large batches of input data requires an unacceptable waiting time prompting a trade off between throughput and latency We also develop an optimization technique for GPU based applications to address the memory bottleneck issue by utilizing the GPU L2 cache to shorten data access time Moreover in the area of graphics applications and in particular with a focus on mobile games we propose a power management scheme to reduce the GPU power consumption by dynamically adjusting the display resolution while considering the user s visual perception at various resolutions We also discuss the collective impact of the proposed techniques in tackling the design challenges of emerging complex systems The proposed techniques are assessed by real life experimentations on GPU based hardware platforms which demonstrate the superior performance of our approaches as compared to the state of the art techniques
