Scheduling Michael L. Pinedo, 2012-01-07 This new edition of the well established text *Scheduling Theory Algorithms and Systems* provides an up to date coverage of important theoretical models in the scheduling literature as well as significant scheduling problems that occur in the real world It again includes supplementary material in the form of slide shows from industry and movies that show implementations of scheduling systems The main structure of the book as per previous edition consists of three parts The first part focuses on deterministic scheduling and the related combinatorial problems The second part covers probabilistic scheduling models in this part it is assumed that processing times and other problem data are random and not known in advance The third part deals with scheduling in practice it covers heuristics that are popular with practitioners and discusses system design and implementation issues All three parts of this new edition have been revamped and streamlined The references have been made completely up to date Theoreticians and practitioners alike will find this book of interest Graduate students in operations management operations research industrial engineering and computer science will find the book an accessible and invaluable resource *Scheduling Theory Algorithms and Systems* will serve as an essential reference for professionals working on scheduling problems in manufacturing services and other environments

Reviews of third edition This well established text covers both the theory and practice of scheduling The book begins with motivating examples and the penultimate chapter discusses some commercial scheduling systems and examples of their implementations *Mathematical Reviews* 2009 , *Scheduling* Michael L. Pinedo, 2022-12-13 The sixth edition provides expanded Discussion and Comments and References sections at the end of each chapter creating a spotlight on practical applications of the theory presented in that chapter New topics include rules for stochastic parallel machine scheduling and for stochastic online scheduling models of flow shops with reentry fixed parameter tractability and new designs and implementations of scheduling systems The main structure of the book as per previous edition consists of three parts The first part focuses on deterministic scheduling and the related combinatorial problems The second part covers probabilistic scheduling models in this part it is assumed that processing times and other problem data are random and not known in advance The third part deals with scheduling in practice it covers heuristics that are popular with practitioners and discusses system design and implementation issues All three parts of this new edition have been revamped and streamlined and the references have been made up to date Theoreticians and practitioners alike will find this book of interest Graduate students in operations management operations research industrial engineering and computer science will find the book an accessible and invaluable resource *Scheduling Theory Algorithms and Systems* will serve as an essential reference for professionals working on scheduling problems in manufacturing services and other environments Michael L Pinedo is the Julius Schlesinger Professor of Operations Management in the Stern School of Business at New York University [Data-Intensive Workflow Management](#) Daniel C. M. de Oliveira, Ji Liu, Esther Pacitti, 2022-06-01 Workflows may be defined as abstractions

used to model the coherent flow of activities in the context of an in silico scientific experiment They are employed in many domains of science such as bioinformatics astronomy and engineering Such workflows usually present a considerable number of activities and activations i e tasks associated with activities and may need a long time for execution Due to the continuous need to store and process data efficiently making them data intensive workflows high performance computing environments allied to parallelization techniques are used to run these workflows At the beginning of the 2010s cloud technologies emerged as a promising environment to run scientific workflows By using clouds scientists have expanded beyond single parallel computers to hundreds or even thousands of virtual machines More recently Data Intensive Scalable Computing DISC frameworks e g Apache Spark and Hadoop and environments emerged and are being used to execute data intensive workflows DISC environments are composed of processors and disks in large commodity computing clusters connected using high speed communications switches and networks The main advantage of DISC frameworks is that they support and grant efficient in memory data management for large scale applications such as data intensive workflows However the execution of workflows in cloud and DISC environments raise many challenges such as scheduling workflow activities and activations managing produced data collecting provenance data etc Several existing approaches deal with the challenges mentioned earlier This way there is a real need for understanding how to manage these workflows and various big data platforms that have been developed and introduced As such this book can help researchers understand how linking workflow management with Data Intensive Scalable Computing can help in understanding and analyzing scientific big data In this book we aim to identify and distill the body of work on workflow management in clouds and DISC environments We start by discussing the basic principles of data intensive scientific workflows Next we present two workflows that are executed in a single site and multi site clouds taking advantage of provenance Afterward we go towards workflow management in DISC environments and we present in detail solutions that enable the optimized execution of the workflow using frameworks such as Apache Spark and its extensions

Generic Multi-Agent Reinforcement Learning Approach for Flexible Job-Shop Scheduling

Schirin Bär,2022-10-01 The production control of flexible manufacturing systems is a relevant component that must go along with the requirements of being flexible in terms of new product variants new machine skills and reaction to unforeseen events during runtime This work focuses on developing a reactive job shop scheduling system for flexible and re configurable manufacturing systems Reinforcement Learning approaches are therefore investigated for the concept of multiple agents that control products including transportation and resource allocation

Scheduling Michael Pinedo,2002 Focusing on theory and applications of scheduling the applications are drawn primarily from production and manufacturing environments but state principles that are relevant to other settings as well The broad range of topics includes deterministic and stochastic models

Automated Technology for Verification and Analysis Kedar Namjoshi,Tomohiro Yoneda,Teruo Higashino,Yoshio Okamura,2007-11-04 This book constitutes the refereed proceedings of the 5th International Symposium on Automated

Technology for Verification and Analysis ATVA 2007 The 29 revised full papers presented together with seven short papers address theoretical methods to achieve correct software or hardware systems including both functional and non functional aspects as well as applications of theory in engineering methods and particular domains and handling of practical problems occurring in tools

Auftragsbasierte Belegungsplanung von Stranggießanlagen in der stahlerzeugenden Industrie Matthias Wichmann, 2013-11-12 Das Stranggießen als Bindeglied zwischen der prozessindustriellen Verarbeitung flüssiger Chargen und der fertigungsindustriellen Generierung einzelner Brammen weist ein hohes Maß an planerischen Freiheitsgraden auf, welche bislang kaum systematisch ausgenutzt werden. Matthias Wichmann entwickelt ein Planungssystem zur optimalen Nutzung der Freiheitsgrade im Rahmen der Gestaltung und Sequenzierung von Chargen und Brammen. Das Einsatzpotential des Systems wird in einer an Realdaten angelehnten Fallstudie aufgezeigt.

Dezentrale Koordination von Produktions-/Instandhaltungs-Systemen Michael Kaluzny, 2014-09-15 Die ökonomische Gestaltung von Instandhaltungsmaßnahmen ist ein relevantes Thema in der Betriebswirtschaft. Durch eine Verbesserung des Anlagenzustands soll deren Leistungsfähigkeit erhöht werden. Der Fall externer Instandhaltungsdienstleister gewinnt in der Praxis immer mehr an Bedeutung. Hierbei ist eine dezentrale Koordination der Produktions- und Instandhaltungsprozesse notwendig, die der Autonomie von Produktion und Instandhaltung gerecht wird. Michael Kaluzny schlägt hierzu einen Ansatz auf der Grundlage einer Kanban-ähnlichen Steuerung vor, bei dem sowohl von der Produktion als auch von der Instandhaltung Einstellungen vorgenommen werden können. In diesem Kontext behandelt der Autor die zustandsorientierte Instandhaltung und die dynamische Reihenfolgeplanung von Instandhaltungsaufträgen.

Deterministic Scheduling Theory R. Gary Parker, 1996-02-01 The principal theme of this book is combinatorial scheduling. All coverage is confined to deterministic results and includes conventional models involving single and multiple processors as well as ones of the classic flow and job shop like variety. In addition the book discusses workforce staffing models, timetabling problems, the classroom assignment model and even problems related to traversals in graphs. The author has included understandable descriptions of computational algorithms, demonstrations of algorithms and theorems with sample problems and substantial lists of end of chapter exercises which span from relatively routine manipulation to increasingly challenging, possibly even open problems. An entire chapter is included on background material. Covered are basic concepts in computational complexity, the theory of graphs and partial enumeration. The book should appeal to students and researchers in a host of areas including industrial engineering, operations research, computer science and discrete mathematics.

Handbook of Scheduling Joseph Y.-T. Leung, 2004-04-27 Researchers in management, industrial engineering, operations and computer science have intensely studied scheduling for more than 50 years, resulting in an astounding body of knowledge in this field. Handbook of Scheduling: Algorithms, Models, and Performance Analysis, the first handbook on scheduling, provides full coverage of the most recent and advanced topics on the subject. It assembles researchers from all relevant disciplines in order to facilitate cross fertilization.

and create new scheduling insights The book comprises six major parts each of which breaks down into smaller chapters Part I introduces materials and notation with tutorials on complexity theory and algorithms for the minimization of makespan total completion time dual objectives maximum lateness the number of late jobs and total tardiness Part II is devoted to classical scheduling problems Part III explores scheduling models that originate in computer science operations research and management science Part IV examines scheduling problems that arise in real time systems focusing on meeting hard deadline constraints while maximizing machine utilization Part V discusses stochastic scheduling and queueing networks highlighting jobs that are not deterministic Part VI covers applications discussing scheduling problems in airline process and transportation industries as well as in hospitals and educational institutions

Scheduling Theory Viacheslav Sergeevich Tanaev, Valerii Sergeevich Gordon, 1994 Models and Algorithms of Time-Dependent Scheduling Stanisław Gawiejniewicz, 2020-06-13 This is a comprehensive study of various time dependent scheduling problems in single parallel and dedicated machine environments In addition to complexity issues and exact or heuristic algorithms which are typically presented in scheduling books the author also includes more advanced topics such as matrix methods in time dependent scheduling time dependent scheduling with two criteria and time dependent two agent scheduling The reader should be familiar with the basic notions of calculus discrete mathematics and combinatorial optimization theory while the book offers introductory material on theory of algorithms NP complete problems and the basics of scheduling theory The author includes numerous examples figures and tables he presents different classes of algorithms using pseudocode he completes all chapters with extensive bibliographies and he closes the book with comprehensive symbol and subject indexes The previous edition of the book focused on computational complexity of time dependent scheduling problems In this edition the author concentrates on models of time dependent job processing times and algorithms for solving time dependent scheduling problems The book is suitable for researchers working on scheduling problem complexity optimization heuristics and local search algorithms

Scheduling Theory. Single-Stage Systems Viacheslav Sergeevich Tanaev, Valerii Sergeevich Gordon, 1994-05-31 Scheduling theory is an important branch of operations research Problems studied within the framework of that theory have numerous applications in various fields of human activity As an independent discipline scheduling theory appeared in the middle of the fifties and has attracted the attention of researchers in many countries In the Soviet Union research in this direction has been mainly related to production scheduling especially to the development of automated systems for production control In 1975 Nauka Science Publishers Moscow issued two books providing systematic descriptions of scheduling theory The first one was the Russian translation of the classical book Theory of Scheduling by American mathematicians R W Conway W L Maxwell and L W Miller The other one was the book Introduction to Scheduling Theory by Soviet mathematicians V S Tanaev and V V Shkurba These books well complement each other Both books well represent major results known by that time contain an exhaustive bibliography on the subject Thus the books as well as the

Russian translation of Computer and Job Shop Scheduling Theory edited by E G Coffman Jr Nauka 1984 have contributed to the development of scheduling theory in the Soviet Union Many different models the large number of new results make it difficult for the researchers who work in related fields to follow the fast development of scheduling theory and to master new methods and approaches quickly Scheduling Theory and Its Applications Philippe Chrétienne,1995-09-11 Covering deterministic scheduling stochastic scheduling and the probabilistic analysis of algorithms this unusually broad view of the subject brings together tutorials surveys and articles with original results from foremost international experts The contributions reflect the great diversity in scheduling theory in terms of academic disciplines applications areas fundamental approaches and mathematical skills This book will help researchers to be aware of the progress in the various areas of specialization and the possible influences that this progress may have on their own specialities Few disciplines are driven so much by continually changing and expanding technology a fact that gives scheduling a permanence while adding to the excitement of designing and analyzing new systems The book will be a vital resource for researchers and graduate students of computer science applied mathematics and operational research who wish to remain up to date on the scheduling models and problems of many of the newest technologies in industry commerce and the computer and communications sciences

Introduction to Scheduling Yves Robert,Frederic Vivien,2009-11-18 Full of practical examples Introduction to Scheduling presents the basic concepts and methods fundamental results and recent developments of scheduling theory With contributions from highly respected experts it provides self contained easy to follow yet rigorous presentations of the material The book first classifies scheduling problems and **Time-Dependent Scheduling** Stanislaw Gawiejnowicz,2008-09-26 Time dependent scheduling involves problems in which the processing times of jobs depend on when those jobs are started This book is a comprehensive study of complexity results and optimal and suboptimal algorithms concerning time dependent scheduling in single parallel and dedicated machine environments In addition to complexity issues and exact or heuristic algorithms which are typically presented in scheduling books the author also includes more advanced topics such as matrix methods in time dependent scheduling and time dependent scheduling with two criteria The reader should be familiar with basic notions of calculus discrete mathematics and combinatorial optimization theory while the book offers introductory material on NP complete problems and the basics of scheduling theory The author includes numerous examples figures and tables he presents different classes of algorithms using pseudocode and he completes the book with an extensive bibliography and author symbol and subject indexes The book is suitable for researchers working on scheduling problem complexity optimization heuristics and local search algorithms Scheduling with Time-Changing Effects and Rate-Modifying Activities Vitaly A. Strusevich,Kabir Rustogi,2016-10-18 In scheduling theory the models that have attracted considerable attention during the last two decades allow the processing times to be variable i e to be subjected to various effects that make the actual processing time of a job dependent on its location in a schedule The impact

of these effects includes but is not limited to deterioration and learning Under the first type of effect the later a job is scheduled the longer its actual processing time becomes In the case of learning delaying a job will result in shorter processing times Scheduling with Time Changing Effects and Rate Modifying Activities covers and advances the state of the art research in this area The book focuses on single machine and parallel machine scheduling problems to minimize either the maximum completion time or the sum of completion times of all jobs provided that the processing times are subject to various effects Models that describe deterioration learning and general non monotone effects to be considered include positional start time dependent cumulative and their combinations which cover most of the traditionally used models The authors also consider more enhanced models in which the decision maker may insert certain Rate Modifying Activities RMA on processing machines such as for example maintenance or rest periods In any case the processing times of jobs are not only dependent on effects mentioned above but also on the place of a job in a schedule relative to an RMA For most of the enhanced models described in the book polynomial time algorithms are presented which are based on similar algorithmic ideas such as reduction to linear assignment problems in a full form or in a reduced form discrete convexity and controlled generation of options

Handbook on Scheduling Jacek Blazewicz, Klaus H. Ecker, Erwin Pesch, Günter Schmidt, Jan Weglarz, 2007-08-10 This handbook is in a sense a continuation of Scheduling Computer and Manufacturing Processes 1 two editions of which have received kind acceptance of a wide readership As the previous volume it is the result of a long lasting German Polish collaboration However due to important reasons it has a new form Namely following the suggestions of the Publisher we decided to prepare a handbook filling out a gap on the market in the area The gap concerns a unified approach to the most important scheduling models and methods with the special emphasis put on their relevance to practical situations Thus in comparison with 1 the contents has been changed significantly This concerns not only corrections we have introduced following the suggestions made by many readers we are very grateful to all of them and taking into account our own experience but first of all this means that important new material has been added It is characterized in Chapter 1 and generally speaking covers a transition from theory to applications in a wide spectrum of scheduling problems independently of this in all chapters new results have been reported and new illustrative material including real world problems has been given We very much hope that in this way the handbook will be of interest to a much wider readership than the former volume the fact which has been underlined in the title

Scheduling Algorithms Peter Brucker, 2007-07-18 Besides scheduling problems for single and parallel machines and shop scheduling problems the book covers advanced models involving due dates sequence dependent changeover times and batching Also multiprocessor task scheduling and problems with multi purpose machines are discussed The methods used to solve these problems are linear programming dynamic programming branch and bound algorithms and local search heuristics Complexity results for different classes of deterministic scheduling problems are summarized
