

which maintains the total number of divisional games in the second half of the season, we iteratively modify CPLEX's popular procedure to create a first-phase reduction pool and gather all distinct optimal solutions in the first-phase reduction pool. For each solution coming out of the first phase, we run the second-phase MIP as an to generate schedules with the minimum possible LMTF, and the minimum number of teams that are exposed to the resulting optimal value of the LMTF and gathered the resulting schedules in the second-phase reduction pool. Since the second-phase generates final schedules that are optimal with respect to the final weekly matchups from the first-phase, different first-phase solutions may lead to schedules differing in LMTF, and the number of teams with the resulting LMTF. Therefore, we refined the second-phase reduction pool in three stages with respect to the lexicographic order of the criteria (C3)-(C4). First, we built a secondary pool consisting of final schedules with the lower value for the LMTF. Then, we filtered the schedules of this secondary pool that have the minimum number of teams with the LMTF into a third pool. Because the schedules in the third pool differ only in criteria (C3)-(C4) and those with lower value for each of these criteria are more desirable, we formed a final pool of schedules that are more dominated with respect to criteria (C3)-(C4) in the third pool. We provide a schematic representation of this refinement process in Figure 3 and in the rest of this section we will present the major characteristics of the schedules in the final pool.

Figure 3: Demonstration of the solution filtering process

3.1. Comparison with the Actual NFL Schedules: Given the NFL has been scheduling a Thursday game for each team since the 2012 season, using final, season-specific opponent lists for each team, we illustrate how the TPM could identify the schedules that are actually employed by the NFL for the 2012-2014 seasons. Our experiments demonstrate that the schedules generated by the TPM outperform the actual NFL schedules in disseminating games against more-rival opponents to teams. We compare the performance of the actual NFL schedules in the four major criteria to those from the TPM in the table below:

Season	LMTF	Number of Teams with LMTF	Max. Two-week Effect	Corresponding Number of Teams	Max. Combined Effect	Corresponding Number of Teams	Total Rk	Total Triple Rk
NFL	2012	0	2	0	0	0	2	0
	2013	0	0	2	0	0	2	0
	2014	2	0	0	0	0	4	0
Season								
TPM	2012	2	0	0	0	0	0	0
	2013	0	0	0	0	0	0	0
	2014	0	0	0	0	0	0	0

Table 3: Major features of the actual NFL schedules and a sample of schedules from the TPM for 2012-2014 seasons

Similar to the definition of a Thursday effect, we call each game that is played against an opponent coming off a bye a "two-week effect" or the two-week team. In Table 3, the fourth column represents the maximum two-week effect across all teams longer and the fifth column represents the number of teams that are exposed to that extreme effect. The sixth column represents the maximum combined effect, i.e., maximum number of games played against more-rival opponents (those coming off a bye or a Thursday game) and the seventh column denotes the corresponding number of teams with the maximum combined effect.

Unlike the actual schedules, the schedules achieved by the TPM are devoid of any two-week effects and lower the LMTF to almost the minimum achievable value. While the maximum combined effect across all teams was no less than 4 in the actual NFL schedules, our approach was able to generate schedules where no team plays more than 2 games against more-rival opponents. Moreover, a two-week effect is more disadvantageous than a Thursday effect for a team by providing longer preparation time for the opponent. Due to absence of the two-week effects in our schedules, our combined effects consist of only Thursday effects and hence provide better balanced schedules.

We also investigated the flexibility of the schedules released by the NFL and sought more balanced Thursday game assignments for the 2012-2014 seasons using a subset of the second-phase constraints, that are mainly associated with the Thursday game assignments. Given the final weekly matchups and their team-rival information from the NFL, there was no assignment of Thursday games to weeks satisfying all constraints on scheduling of Thursday and short week games. From Table 3 as the TPM could clearly generate weekly matchups which allow feasible Thursday game assignments for the 2012-2014 seasons, the inflexibility of the actual NFL schedules reveals the importance of the assignment of games to weeks for providing disadvantage due to short week-related moral obligations and rest duration. It also verifies the generality of a two-phase approach such as ours in seeking solutions to the problem.
