Rothman,2002-02-07 In the past thirty years epidemiology

has matured from a fledgling scientific field into a vibrant discipline that brings together the biological and social sciences and in doing so draws upon disciplines ranging from statistics and survey sampling to the philosophy of science. These areas of knowledge have converged into a modern theory of epidemiology that has been slow to penetrate into textbooks particularly at the introductory level. *Epidemiology: An Introduction* closes the gap. It begins with a brief lucid discussion of causal thinking and causal inference and then takes the reader through the elements of epidemiology focusing on the measures of disease occurrence and causal effects. With these building blocks in place, the reader learns how to design, analyze, and interpret problems that epidemiologists face, including confounding, the role of chance, and the exploration of interactions. All these topics are layered on the foundation of basic principles presented in simple language with numerous examples and questions for further thought.

A Prospective Randomized Study to Determine the Effects of a Prenatal Immunization Intervention on Timeliness of Infant Immunization Schedule Initiation in Two San Diego County Community Clinics Maria Luisa Zuniga de Nuncio, 1999. Latino infants suffer from lower immunization levels than non-Latino White infants. In 1993 and 1994, Latino infants had the lowest immunization levels in San Diego County: 43% and 57% respectively, and according to county DHS statistics represented 45% of pertussis cases in 1993. *Building Healthier Futures Data Supplement 1996*. This prospective randomized study was designed to assess the effectiveness of an immunization educational intervention delivered to Latinas in their third trimester of pregnancy on subsequent initiation of their infant's immunization series. Timely initiation of the immunization series is associated with receiving subsequent immunizations at the recommended time intervals. The study hypothesis was that providing Latinas with immunization education and promoting timely initiation of their infant's immunization through incorporation of components of the Health Belief Model would result in an increase in the proportion of infants that are up to date by the recommended two-month age marker. The rationale for providing immunization information shortly before birth of the child is based on the concept of a teachable moment, a period when individuals actively seek out information and are motivated to learn. The intervention was effective in increasing knowledge of the immunization schedule and supports the concept that the third trimester of pregnancy is a highly teachable moment. However, the lack of significant association between the intervention and initiation of the immunization series raises questions about the relative importance of parent education in timely immunization, particularly in clinics with relatively high immunization levels. Prior to this study, the role of providing pregnant women with immunization education and skills to facilitate timely initiation of their infant's immunization series had not been formally evaluated in a randomized prospective study. This study contributes information about educational messages and behavior to the knowledge base of immunization research. It demonstrates that factors other than parental knowledge of immunization timeliness contribute more to immunization up-to-date status than knowledge of immunization timing itself. Focusing on WIC immunization linkages and on clinic and health care provider practices in determining successful immunization appear to be much more powerful and

effective in terms of future interventions *The Cancer Handbook, 2 Volume Set* Malcolm Alison, 2007-07-30 The Cancer Handbook provides a comprehensive overview of scientific and clinical information in cancer research and medicine oncology This area is one of the most intensively studied in biology and medicine resulting in a huge amount of new information being published every year This book summarizes and explains key facts and recent developments It is aimed at a wide variety of readers who need easy access to knowledge concerning all major aspects of cancer biology without too much clinical detail or specialist research material The Cancer Handbook stands out from existing oncology textbooks and reference works in that it bridges the gap between the molecular biology of cancer and clinical diagnosis and treatment As more and more laboratory research is applied to clinical management e g the use of monoclonal antibodies as drugs it is important that clinicians understand the aetiology of the disease and the molecular basis of the new therapeutic approaches It is also important for laboratory scientists to appreciate the potential applications of their research and the practical issues involved in translating it to clinical practice For this second edition all the sections have been fully revised and updated with new chapters addressing important topics that have gained prominence in recent years New editors and authors have brought additional expertise to the project For example in the section on the Molecular and Cellular Basis of Cancer there are new chapters on stem cells epigenetics and microRNAs as well as chapters on the links between cancer and development and inflammation In the Treatment section the emphasis is now on multidisciplinary team management of different cancers plus there are new chapters on clinical trial design RNA interference and rational drug design The page design and the quality of the diagrams has been improved with all illustrations now in full colour The glossary has been made more informative and easy to use *Applied Survival Analysis* David W. Hosmer, Jr., Stanley Lemeshow, 1999-01-21 A Practical Up To Date Guide To Modern Methods In The Analysis Of Time To Event Data The rapid proliferation of powerful and affordable statistical software packages over the past decade has inspired the development of an array of valuable new methods for analyzing survival time data Yet there continues to be a paucity of statistical modeling guides geared to the concerns of health related researchers who study time to event data This book helps bridge this important gap in the literature Applied Survival Analysis is a comprehensive introduction to regression modeling for time to event data used in epidemiological biostatistical and other health related research Unlike other texts on the subject it focuses almost exclusively on practical applications rather than mathematical theory and offers clear accessible presentations of modern modeling techniques supplemented with real world examples and case studies While the authors emphasize the proportional hazards model descriptive methods and parametric models are also considered in some detail Key topics covered in depth include Variable selection Identification of the scale of continuous covariates The role of interactions in the model Interpretation of a fitted model Assessment of fit and model assumptions Regression diagnostics Recurrent event models frailty models and additive models Commercially available statistical software and getting the most out of it Applied Survival Analysis is an ideal introduction for graduate

students in biostatistics and epidemiology as well as researchers in health related fields
