Modular Representation Theory Of Finite Groups:

Modular Representation Theory of Finite Groups Peter Schneider, 2012-11-27 Representation theory studies maps from groups into the general linear group of a finite dimensional vector space For finite groups the theory comes in two distinct flavours In the semisimple case for example over the field of complex numbers one can use character theory to completely understand the representations This by far is not sufficient when the characteristic of the field divides the order of the group Modular Representation Theory of finite Groups comprises this second situation Many additional tools are needed for this case To mention some there is the systematic use of Grothendieck groups leading to the Cartan matrix and the decomposition matrix of the group as well as Green's direct analysis of indecomposable representations There is also the strategy of writing the category of all representations as the direct product of certain subcategories the so called blocks of the group Brauer's work then establishes correspondences between the blocks of the original group and blocks of certain subgroups the philosophy being that one is thereby reduced to a simpler situation In particular one can measure how nonsemisimple a category a block is by the size and structure of its so called defect group All these concepts are made explicit for the example of the special linear group of two by two matrices over a finite prime field Although the presentation is strongly biased towards the module theoretic point of view an attempt is made to strike a certain balance by also showing the reader the group theoretic approach In particular in the case of defect groups a detailed proof of the equivalence of the two approaches is given This book aims to familiarize students at the masters level with the basic results tools and techniques of a beautiful and important algebraic theory Some basic algebra together with the semisimple case are assumed to be known although all facts to be used are restated without proofs in the text Otherwise the book is entirely self contained

Modular Representation Theory of Finite Groups Michael John Collins, Brian Parshall, Leonard L. Scott, 2001 The series is aimed specifically at publishing peer reviewed reviews and contributions presented at workshops and conferences Each volume is associated with a particular conference symposium or workshop These events cover various topics within pure and applied mathematics and provide up to date coverage of new developments methods and applications Modular Representation Theory of Finite Groups Peter Schneider, 2012-11-21 Representation theory studies maps from groups into the general linear group of a finite dimensional vector space For finite groups the theory comes in two distinct flavours In the semisimple case for example over the field of complex numbers one can use character theory to completely understand the representations This by far is not sufficient when the characteristic of the field divides the order of the group Modular Representation Theory of finite Groups comprises this second situation Many additional tools are needed for this case To mention some there is the systematic use of Grothendieck groups leading to the Cartan matrix and the decomposition matrix

of the group as well as Green's direct analysis of indecomposable representations. There is also the strategy of writing the category of all representations as the direct product of certain subcategories, the so-called blocks of the group. Brauer's work then establishes correspondences between the blocks of the original group and blocks of certain subgroups, the philosophy being that one is thereby reduced to a simpler situation. In particular, one can measure how nonsemisimple a category a block is by the size and structure of its so-called defect group. All these concepts are made explicit for the example of the special linear group of two by two matrices over a finite prime field. Although the presentation is strongly biased towards the module theoretic point of view, an attempt is made to strike a certain balance by also showing the reader the group theoretic approach. In particular, in the case of defect groups, a detailed proof of the equivalence of the two approaches is given. This book aims to familiarize students at the masters level with the basic results, tools, and techniques of a beautiful and important algebraic theory. Some basic algebra together with the semisimple case are assumed to be known, although all facts to be used are restated without proofs in the text. Otherwise, the book is entirely self-contained.

Group Representation Theory: Modular representation theory Larry L. Dornhoff, 1971 **Modular Representation Theory Of Finite And P-adic Groups**

Wee Teck Gan, Kai Meng Tan, 2015-02-13 This volume is an outgrowth of the program Modular Representation Theory of Finite and p -Adic Groups held at the Institute for Mathematical Sciences at National University of Singapore during the period of 1-26 April 2013. It contains research works in the areas of modular representation theory of p -adic groups and finite groups and their related algebras. The aim of this volume is to provide a bridge where interactions are rare between researchers from these two areas by highlighting the latest developments, suggesting potential new research problems, and promoting new collaborations. It is perhaps one of the few volumes if not only which treats such a juxtaposition of diverse topics, emphasizing their common core at the heart of Lie theory.

Modular Representations of Finite Groups of Lie Type James E. Humphreys, 2006 A comprehensive treatment of the representation theory of finite groups of Lie type over a field of the defining prime characteristic.

Local Representation Theory J. L. Alperin, Jonathan L. Alperin, 1993-09-24 The aim of this text is to present some of the key results in the representation theory of finite groups. In order to keep the account reasonably elementary so that it can be used for graduate level courses, Professor Alperin has concentrated on local representation theory, emphasising module theory throughout. In this way, many deep results can be obtained rather quickly. After two introductory chapters, the basic results of Green are proved, which in turn lead in due course to Brauer's First Main Theorem. A proof of the module form of Brauer's Second Main Theorem is then presented, followed by a discussion of Feit's work connecting maps and the Green correspondence. The work concludes with a treatment new in part of the Brauer-Dade theory. As a text, this book contains ample material for a one-semester course. Exercises are provided at the end of most sections; the results of some are used later in the text. Representation theory is applied in number theory, combinatorics, and in many areas of algebra. This book will serve as an excellent introduction to those interested in the subject itself or its

applications **Modular Representation Theory of Finite Groups** Alex Wilson, 2016-10-01 In mathematics representation theory is a technique for analyzing abstract groups in terms of groups of linear transformations Representation theory studies maps from groups into the general linear group of a finite dimensional vector space For finite groups the theory comes in two distinct flavors In the semisimple case for example over the field of complex numbers one can use character theory to completely understand the representations This by far is not sufficient when the characteristic of the field divides the order of the group Modular representation theory is a branch of mathematics and that part of representation theory that studies linear representations of finite groups over a field K of positive characteristic As well as having applications to group theory modular representations arise naturally in other branches of mathematics such as algebraic geometry coding theory combinatorics and number theory This book aims to the modular representation theory of finite groups from an algebraic point of view regarding representations as modules over the group algebra **Modular Representation Theory of Finite Groups** Caroline Lassueur, Niamh Farrell, 2020 Quivers and the Modular Representation Theory of Finite Groups Stuart Martin, 1988 **Modular Representations of Finite Groups of Lie Type** James E. Humphreys, 2006 Comprehensive treatment of the representation theory of finite groups of Lie type over a field of the defining prime characteristic *G-algebras and Modular Representation Theory* Jacques Thévenaz, 1995 This book gives a comprehensive treatment of the theory of G Algebras and shows how it can be used to solve a number of problems about blocks modules and almost split sequences The new approach to modular representation theory of finite groups was developed mainly by Lluís Puig since the 1970s and has several characteristic features unification of several theories e g block theory and module theory under a single concept introduction of new invariants e g source algebras and multiplicity modules which shed new light on the whole new point of view on some classical theorems e g Brauer's second main theorem yielding more precise results deep structural results such as Puig's theory on nilpotent blocks Modular Representation Theory D. Benson, 2008-07-22 The aim of this 1983 Yale graduate course was to make some recent results in modular representation theory accessible to an audience ranging from second year graduate students to established mathematicians After a short review of background material three closely connected topics in modular representation theory of finite groups are treated representations rings almost split sequences and the Auslander-Reiten quiver complexity and cohomology varieties The last of these has become a major theme in representation theory into the 21st century Some of this material was incorporated into the author's 1991 two volume *Representations and Cohomology* but nevertheless *Modular Representation Theory* remains a useful introduction Modular Representation Theory of Finite Groups Andrei Mărcuș, 2002 **Characters and Blocks of Finite Groups** Gabriel Navarro, 1998-05-07 This is a clear accessible and up to date exposition of modular representation theory of finite groups from a character theoretic viewpoint After a short review of the necessary background material the early chapters introduce Brauer characters and blocks and develop their basic

properties The next three chapters study and prove Brauer's first, second and third main theorems in turn These results are then applied to prove a major application of finite groups the Glauberman Z theorem Later chapters examine Brauer characters in more detail The relationship between blocks and normal subgroups is also explored and the modular characters and blocks in p -solvable groups are discussed Finally the character theory of groups with a Sylow p subgroup of order p is studied Each chapter concludes with a set of problems The book is aimed at graduate students with some previous knowledge of ordinary character theory and researchers studying the representation theory of finite groups

The Arcata Conference on Representations of Finite Groups, Part 1 Paul Fong, 1987 The papers in these proceedings of the 1986 Arcata Summer Institute bear witness to the extraordinarily vital and intense research in the representation theory of finite groups The confluence of diverse mathematical disciplines has brought forth work of great scope and depth Particularly striking is the influence of algebraic geometry and cohomology theory in the modular representation theory and the character theory of reductive groups over finite fields and in the general modular representation theory of finite groups The continuing developments in block theory and the general character theory of finite groups is noteworthy The expository and research aspects of the Summer Institute are well represented by these papers

Finite Groups II B. Huppert, N. Blackburn, 2012-12-06 17 t t L It CIFDr wei unsre Weisheit Einfalt ist From Lohengrin Richard Wagner At the time of the appearance of the first volume of this work in 1967 the tempestuous development of finite group theory had already made it virtually impossible to give a complete presentation of the subject in one treatise The present volume and its successor have therefore the more modest aim of giving descriptions of the recent development of certain important parts of the subject and even in these parts no attempt at completeness has been made Chapter VII deals with the representation theory of finite groups in arbitrary fields with particular attention to those of non zero characteristic That part of modular representation theory which is essentially the block theory of complex characters has not been included as there are already monographs on this subject and others will shortly appear Instead we have restricted ourselves to such results as can be obtained by purely module theoretical means

Modular Representation Theory Herbert Pahlings, 1973 Representation Theory of Finite Groups and Finite-Dimensional Algebras Michler, Ringel, 2012-12-06 From April 1 1984 until March 31 1991 the Deutsche Forschungsgemeinschaft has sponsored the project Representation Theory of Finite Groups and Finite Dimensional Algebras The proposal for this project was submitted by B Huppert Mainz B Fischer Bielefeld G Michler Essen H Pahlings Aachen and C M Ringel Bielefeld in order to strengthen the interaction between the different research areas in representation theory The Deutsche Forschungsgemeinschaft has given many research positions and fellowships for young algebraists enabling them to do research at their own universities or as visitors at well known research institutions in America Australia England and France The whole project benefitted very much from an extensive exchange programme between German and American scientists sponsored by the Deutsche Forschungsgemeinschaft and by the National Science Foundation of the United States

This volume presents lectures given in a final conference and reports by members of the project. It is divided into two parts. The first part contains seven survey articles describing recent advances in different areas of representation theory. These articles do not only concentrate on the work done by the German research groups but also inform on major developments of the subject at all. The volume omits those topics already treated in book form. In particular it does not contain a survey on K
