

B8.1 Photosynthesis

Question number	Answer	Marks	Guidance
1 a	carbon dioxide from air, water from soil	1 1	
1 b	carbon dioxide and water from water in which it lives, light from Sun or electric light	2 1	
2	Carbon atom moves from air into air spaces in leaf, into plant cells, into chloroplasts, joins with water to make glucose, and is converted to starch for storage.	1 1 1 1 1	
3	Leaf kept in light photosynthesises, making glucose from carbon dioxide and water using energy from light. Glucose converted to starch to be stored and used for respiration when leaf is in dark and cannot photosynthesise. Iodine solution turns blue-black in presence of starch. Carrying out an iodine test on a leaf kept in light for 24 hours will give positive blue-black colour for starch because plant has been photosynthesising for a long time and glucose will have been stored as starch. If leaf is then kept in dark for 24 hours it cannot photosynthesise so cells will use stored starch for respiration. Little or no starch left in the leaves so iodine solution unaffected.	1 1 1 1	
4 a	carbon dioxide + water $\xrightarrow{\text{light}}$ glucose + oxygen	2	
4 b	It needs bigger input of energy from environment to break bonds holding carbon dioxide and water together than is released when new bonds form in glucose and oxygen.	1 1 1
