Molecular Biology Of Iridoviruses Developments In Molecular Virology:

Molecular Biology of Iridoviruses Gholamreza Darai, 1989-10-31 Fish lymphocystis disease virus FLDV has been tentatively classified as a separate genus of the iridovirus family Iridoviruses were previously called icosahedral cytoplasmic deoxyriboviruses ICDV The Iridoviridae family contains four genera including lymphocystis disease virus proposed name Lymphocystivirus Willis 1989 1 FLDV is a causative agent of lymphocystis disease LD which frequently appears in Pleuronectidae flatfish such as *Pleuronectes platessa* plaice *Platichthys flesus* flounder *Limanda limanda* dab and *Trigla gurnardus* gurnard Fish lymphocystis disease is characterized by papilloma like lesions which can be induced experimentally in *Lepomis macrochirus* bluegill 2 and by subdermal injection of plaice and flounder 3 The mechanisms of this nonmalignant tumor induction are unknown Since the discovery of LD in 1874 by Lowe 4 attempts have been made to isolate and propagate FLDV in vitro with limited success 5 7 As a first step towards understanding of the underlying mechanisms of this infectious disease the structure and properties of the causal virus must be elucidated These basic molecular biological studies provide new facilities for investigation of virus host interactions which is necessary for understanding the molecular mechanisms of the viral pathogenesis MATERIALS AND METHODS A total of 30 fish with LD lesions caught near the Doggerbank areas were analyzed individually including 20 flounders six dabs and four plaice Virions of FLDV from LD lesions of each species of fish were isolated purified and examined by electron microscopy as 205 described previously 8 Fig

controversial descriptions in the Virology Division pages of the Archives of Virology this will allow virologists to carry on the kind of interim dialogue that is necessary for arriving at broad agreement on taxonomic matters
