individuals but it can cause serious infections in immune compromised hosts *C albicans* undergoes a meta stable and reversible switch between two distinct cell types known as white and opaque The role of white opaque switching in the biology of *C albicans* was originally not well understood We discovered an unexpected relationship between white opaque switching and the sexual cycle of *C albicans* The mating type locus of *C albicans* MTL encodes transcriptional regulatory proteins that regulate mating We demonstrated that two MTL encoded homeodomain proteins $\alpha 1$ and $\alpha 2$ work together to repress white opaque switching in *C albicans* The observations that the MTL locus controlled both mating and white opaque switching led us to hypothesize that opaque cells played a role in mating Indeed we found that opaque cells mate one million times more efficiently than do white cells Additionally opaque cells but not white cells developed specialized mating projections when exposed to mating pheromone Thus opaque cells are a specialized mating form of *C albicans* As white cells are generally more robust in a mammalian host than opaque cells this strategy allows the organism to survive the rigors of life within a mammalian host while generating a small population of mating competent cells The mechanism that controls white opaque switching is not well understood To better understand the mechanism we investigated the regulation of white opaque switching by $\alpha 1$ $\alpha 2$ We demonstrated that $\alpha 1$ $\alpha 2$ regulates white opaque switching by destabilizing opaque cells and we monitored gene expression during the transition from opaque to white using DNA microarrays We used a candidate approach to identify additional regulators of white opaque switching among genes enriched for their expression in the opaque phase We identified two potent positive regulators of white opaque switching the opaque specific transcriptional regulatory proteins Czf1 and Naf1 We also further investigated the role of Efg1 a previously identified regulator of white opaque switching and found that efg1 efg1 mutants were unable to bypass $\alpha 1$ $\alpha 2$ repression of switching Finally we determined the epistatic and regulatory relationships between Efg1 Czf1 and Naf1
