Education and Development Walter W. McMahon, 2000-01-27 This book develops a new approach to measuring the total returns to human resource development through investment in education Drawing on microanalytic foundations it uses regional and worldwide data to estimate the net marginal contributions of education and new knowledge both to economic growth and to wider effects on democratization human rights political stability health net population growth rates reduction of poverty inequality in income distribution crime drug use and the environment The total impact of

education policy changes on endogenous development is then estimated using an interactive model This new approach is important to industrialized and developing countries alike The diffusion of knowledge and the adaptation of new techniques has been identified as crucial to the growth process in the new endogenous growth models and is of increasing strategic importance in current knowledge based globalizing economies Similarly the non monetary returns from education are important in improving human welfare Measurement of these non market returns is a crucial but much neglected subject It has proved frustrating and existing microanalytic measures have proved piecemeal The new approach developed here offers some comprehensive estimates and simulation techniques for finding more cost effective policies and also suggests new hypotheses for further microanalytic testing

Forest Hydrology Mingteh Chang, 2006-05-25 Although a few texts on forest hydrology are available they cover very little if any background on water resources On the other hand books dealing with water resources do not cover topics on forest water relations The one exception to this is *Forest Hydrology An Introduction to Water and Forests* Now with the publication of a revised edition this volume adds information from recent studies to go even further in providing an introduction to forest hydrology that brings water resources and forest water relations into a single practical and comprehensive volume Focusing on processes and general principles the first six chapters provide an introduction and basic background in water and water resources while the last seven chapters look at the impact of forests on water Between these two groupings is a chapter that serves as an entry to the study of forest impacts on water resources describing forests and forest characteristics important to water circulation sediment movement and stream habitat This second edition also features new information on forests and flooding forest and stream habitat snow vaporization processes and GIS methods in hydrology research examples on evaporation estimates and a new appendix on forest interception measurements Employing examples and case studies the book provides tools to help natural resource managers play an active role in policymaking and land use planning and in developing partnerships with stakeholders It also offers unique perspectives for addressing urban sprawl
