Sheep Farming ,2024-09-11 In this volume the latest information on sheep farming concerning the effects of climate change is summarized in eight chapters Climate change basically determines changes in the environment which affect the keeping feeding animal health and breeding conditions of sheep These changes affect the sustainability of sheep farming the sheep s resilience and based on this the livelihood opportunities of the people who keep the sheep In different regions the factors that enable or limit the effectiveness of sheep farming can change to a different degree and form Changes in circumstances make it increasingly important to utilize the elements of precision farming in sheep farming because knowledge of current registration production and location data is essential even in extensive conditions **Food security**

Grazing in Future Multi-scapes: From Thoughtscapes to Landscapes, Creating Health from the Ground Up

Pablo Gregorini, Iain James Gordon, Carol Kerven, Fred Provenza, 2022-09-27 This Research Topic is hosted in partnership with the Grazing in Future Multi Scapes international workshop The workshop will be held online 30th May 5th June 2021

Throughout different landscapes of the world grazing herbivores fulfill essential roles in ecology agriculture economies and cultures including families farms and communities Not only do livestock provide food and wealth they also deliver ecosystem services through the roles they play in environmental composition structure and dynamics Grazing as a descriptive adjective locates herbivores within a spatial and temporal pastoral context where they naturally graze or are grazed by farmers ranchers shepherds etc In many cases however pastoralism with the single objective of maximizing animal production and or profit has transformed landscapes diminishing biodiversity reducing water and air quality accelerating loss of soil and plant biomass and displacing indigenous animals and people These degenerative landscape transformations have jeopardized present and future ecosystem and societal services breaking the natural integration of land water air health society and culture Land users policy makers and societies are calling for alternative approaches to pastoral systems a call for diversified adaptive and integrative agro ecological and food pastoral systems designs that operate across multiple scales and scapes e g thought social land food health wild scapes simultaneously There needs to be a paradigm shift in pastoral production systems and how grazing herbivores are managed grazed within them derived initially from a change in perception of how they provide wealth The thoughtscales will include paradigm shifts where grazers move away from the actual archetype of pastoralism future landscapes are re imagined and regenerative and sustainable management paradigms are put in place to achieve these visions From this will come a change in collective thinking of how communities and cultures socialscapes

perceive their relationships with pastoral lands The landscapes are the biotic and abiotic four dimensional domains or environments in need of nurture Landscapes are the tables where humans and herbivores gain their nourishment i e foodscapes Foodscapes and dietary perceptions dictate actions and reactions that are changing as developed countries grapple with diseases related to obesity and people starve in developing countries Societies are demanding healthscapes and nutraceutical foodscapes and paradoxically some are moving away from animal products While indigenous species of animals including humans wildscapes have been displaced from many of their lands by monotonic pastoralism multifunctional pastoral systems can be designed in view of dynamic multi scapes of the future The purpose of this Research Topic is to influence future mental and practical models of pastoralism in continually evolving multi scapes We seek a collection of papers that will cultivate such a shift in thinking towards future models of sustainable multipurpose pastoralism The contributions will be synthesized to establish how multifunctional pastoral systems can be re imagined and then designed in view of the integrative dynamics of sustainable future multi scapes Why Livestock Genomics for Developing Countries offers Opportunities for Success Farai Catherine Muchadeyi,Eveline M. Leveraging Gender, Youth and Social Networks for Inclusive and Transformative Livestock Production in the Tropics and Subtropics Stefan Burkart,Renee Marie Bullock,Juan Andrés Cardoso Arango,Marcela Ramos ,Natalia Triana Angel,2024-10-14 Social research has provided critical insights into understanding gender and generational gaps and the ways that power relations create differentiated access to agricultural and livestock technologies and services Many of these technologies and services such as improved feed options grass legume associations silvo pastoral systems improved animal genetics health and welfare grazing management and associated water and soil health and manure management have the potential to improve livelihoods sustainability food security and generational transfer dynamics Their adoption contributes to mitigating many of the impacts the livestock sector has on the environment through for example reducing greenhouse gas emissions and deforestation increasing biodiversity restoration and land sparing Likewise their adoption helps producers adapt to climate change *Critical Role of Animal Science Research in Food Security and Sustainability* National Research Council,Division on Earth and Life Sciences,Board on Agriculture and Natural Resources,Policy and Global Affairs,Science and Technology for Sustainability Program,Committee on Considerations for the Future of Animal Science

Research,2015-03-31 By 2050 the world's population is projected to grow by one third reaching between 9 and 10 billion. With globalization and expected growth in global affluence, a substantial increase in per capita meat, dairy, and fish consumption is also anticipated. The demand for calories from animal products will nearly double, highlighting the critical importance of the world's animal agriculture system. Meeting the nutritional needs of this population and its demand for animal products will require a significant investment of resources as well as policy changes that are supportive of agricultural production. Ensuring sustainable agricultural growth will be essential to addressing this global challenge to food security. Critical Role of Animal Science Research in Food Security and Sustainability identifies areas of research and development, technology, and resource needs for research in the field of animal agriculture both nationally and internationally. This report assesses the global demand for products of animal origin in 2050 within the framework of ensuring global food security, evaluates how climate change and natural resource constraints may impact the ability to meet future global demand for animal products in sustainable production systems, and identifies factors that may impact the ability of the United States to meet demand for animal products, including the need for trained human capital, product safety and quality, and effective communication and adoption of new knowledge, information, and technologies. The agricultural sector worldwide faces numerous daunting challenges that will require innovations, new technologies, and new ways of approaching agriculture if the food, feed, and fiber needs of the global population are to be met. The recommendations of Critical Role of Animal Science Research in Food Security and Sustainability will inform a new roadmap for animal science research to meet the challenges of sustainable animal production in the 21st century.

Animal Welfare in Extensive Systems Severiano Silva, George Thomas Stilwell,2023-01-30 *Climate-Smart Livestock Production: Strategies for Enhanced Sustainability and Resilience* Oyegunle Emmanuel Oke, Victoria Anthony Uyanga, Monsuru Oladimeji Abioja, Fisayo Oretomiloye,2025-09-08 Climate smart livestock production is essential for enhancing animal welfare, ensuring food security, and bolstering resilience against climate change as demand for animal sourced foods grows. This field focuses on identifying sustainable strategies at all production scales, from expansive commercial farms to smaller operations. We seek original research and review articles that detail practices and technologies aimed at reducing greenhouse gas emissions, minimizing water pollution, optimizing land use, and improving animal welfare in livestock systems. The sector faces significant challenges from climate change, including heat stress, water scarcity, and heightened disease risks. Adopting climate smart practices such as increasing feed efficiency, streamlining manure management, and utilizing renewable energy are pivotal in creating more sustainable livestock systems. These efforts must integrate animal welfare to ensure the sustainability and resilience of these enterprises over the long term.

Animal Agriculture Fuller W. Bazer, G. Cliff Lamb, Guoyao Wu,2019-10-25 Animal Agriculture Sustainability Challenges and Innovations discusses the land based production of high quality protein by livestock and poultry and how it plays an important role in improving human nutrition, growth, and health. With exponential growth of the global population and marked

risers in meat consumption per capita demands for animal source protein are expected to increase 72% between 2013 and 2050 This raises concerns about the sustainability and environmental impacts of animal agriculture An attractive solution to meeting increasing needs for animal products and mitigating undesirable effects of agricultural practices is to enhance the efficiency of animal growth reproduction and lactation Currently there is no resource that offers specific knowledge of both animal science and technology including biotechnology for the sustainability of animal agriculture for the expanding global demand of food in the face of diminishing resources This book fills that gap giving readers all the necessary information on important issues facing modern animal agriculture namely its sustainability challenges and innovative solutions Integrates new knowledge in animal breeding biotechnology nutrition reproduction and management Addresses the urgent issue of sustainability in modern animal agriculture Provides practical solutions on how to solve the current and future problems that face animal agriculture worldwide

Developments in Bovine Immunology - An Integrated View Kieran G.

Meade, 2015-07-22 The world's population is predicted to hit 9 Billion by 2050 and with it food demand is predicted to increase substantially The World Bank estimates that cereal and meat production needs to increase by 50% and 85% respectively between 2000 and 2030 to meet demand putting serious pressure on the global agricultural industry Critical to meeting this demand for food are mechanisms to reduce the incidence of animal disease With in excess of 1.3 billion cattle globally the total cost of infectious diseases is difficult to estimate However in North America alone the cost is predicted to be 18 billion annually Non infectious diseases also account for another major impediment to the production capacity and welfare of animals as well as the economic sustainability of farming However animal diseases have implications that spread far beyond the farm gate Infectious agents can also contaminate the food chain and potentially affect human health Controlling diseases through better preventative and treatment methods requires a detailed understanding of the immune response in livestock species Multiple studies have identified associations between variation in immune genes and disease susceptibility which potentially opens up new avenues to select animals with superior disease resistance Detailed understanding of immunity in cattle is leading to the design of more effective vaccines Furthermore appreciation of the significant differences between rodent and human immune responses has also led to bovine models being developed for some human diseases The publication of the bovine genome and the advent of next generation sequencing technologies have facilitated a massive expansion in our knowledge of the immune response in cattle As a result there has been an explosion of exciting research findings including in metagenomics and epigenetics Recently there has been a welcome move to integrate our emerging understanding of the immune response with detailed studies of other important physiological processes including nutrition and reproduction The interactions between the reproductive system nutrition and the immune system are of particular interest since each places significant demands on the animal at various stages through the production cycle The interplay between these morphologically diffuse systems involves widely distributed chemical signals in response to

environmental input and each system must interact for the normal functioning of the other A comprehensive systems approach is improving our understanding of normal physiological interactions between these systems and furthermore how dysregulation can lead to disease The successful translation of bovine immunological research into improved treatments for animal disease requires tight interaction between diverse scientific and clinical disciplines including immunology microbiology endocrinology physiology nutrition reproduction and clinical veterinary medicine With so much recent progress in the field we believe that it is valuable and well timed to review the broad variety of the relevant studies that attempt to increase our understanding through comprehensive collaboration between these disciplines We are looking forward to a wide and vivid discussion of developments in bovine immunology and related issues and we expect that our readers profoundly benefit from new exciting insights and fruitful collaborations
