Towards an SSA Based Compiler Back-end Benoit Boissinot, 2010 This thesis is articulated around three topics all of them related to the SSA form First we explore the optimization of liveness algorithms when applied to program in SSA form In particular we present an efficient algorithm based on the structure of the program the loops and based on properties specific to SSA form Next we present an intermediate representation which is a variant of SSA the Static Single Information form SSI We clarify the different definitions for this form which appeared in the literature pointing out the points where they diverge Then we prove that the interference graph the intersection graph of the live ranges of variables under SSI form is an interval graph Finally we propose a new approach to the problem of SSA destruction Our method while simpler than previous approach gives us results comparable to more complex and not always proved approaches
