methods of genetic transformation Since then genomics and biotechnology have impacted all research areas of forestry Genome analyses of tree populations have uncovered genes involved in adaptation and response to biotic and abiotic stress Genes that regulate growth and development have been identified and in many cases their mechanisms of action have been described Genetic transformation is now widely used to understand the roles of genes and to develop germplasm that is more suitable for commercial tree plantations However in contrast to many annual crops that have benefited from centuries of domestication and extensive genomic and biotechnology research in forestry the field is still in its infancy Thus tremendous opportunities remain unexplored This Research Topic aims to briefly summarize recent findings to discuss long term goals and to think ahead about future developments and how this can be applied to improve growth and quality of forest trees
