Meningococcal Disease Andrew J. Pollard, Martin C.J. Maiden, 2008-02-02 Meningococcal septicemia and meningitis continue to be important causes of devastating illness death and long term disability in both developed and resource poor countries of the world Few diseases have attracted as much public attention or are as feared by parents and family members as well as the medical staff who have to care for affected patients The unexpected and unp dictable occurrence of the disease in previously healthy children and young adults its rapid progression and the frequent occurrence of purpura fulminans with the resulting gangrene of limbs and digits and the requirement for mutilating s gery have all heightened both public and medical interest in the disease Over the past two decades there has been a rapid increase in knowledge of many aspects of meningococcal disease as a result of intensive efforts by workers in many different fields clinicians have studied the early presenting features and acute pathophysiology of the disorder clinical scientists have explored the immunopathological mechanisms responsible for disease and have highlighted the important

roles played by the host inflammatory response and pro inflammatory cytokines in mediating damage to blood vessels and organs microbiologists have developed new diagnostic methods public health physicians and epidemiologists have improved surveillance techniques with the help of molecular tools provided by bacterial population biologists and basic scientists have used the powerful new tools in molecular and cell biology to elucidate virulence mechanisms

Reemergence of Established Pathogens in the 21st Century I.W. Fong, Karl Drlica, 2006-04-11 In the closing decade of the last century we saw warnings that infectious diseases will require much more attention from patients and physicians in the 21st century Recently discovered diseases such as AIDS pose a major threat to the population at large and to that threat has been added the re emergence of established pathogens microbes that were readily treatable in the past Since infectious diseases already play a major role in the burden of illness and mortality health care providers and planners are worried A large proportion of the problem is man made arising mainly from the unnecessary overuse of antimicrobials in hospital and community settings and from the agricultural misuse of the agents in animal feed A consequence has been a dramatic increase in resistant strains of bacteria that were considered conquerable several decades ago Community infections caused by multi resistant pneumococci serve as an example These organisms were readily treated with penicillin but now the spread of penicillin resistant *Streptococcus pneumoniae* from continent to continent is becoming a worldwide problem This is a major concern because pneumococcal infections are common in the community being the leading cause of pneumonia sinusitis and meningitis Resistant bacteria in hospitals are also becoming more prevalent We have become accustomed to hearing about methicillin resistant *Staphylococcus aureus* MRSA and vancomycin resistant enterococci VRE but now we have to be concerned about multidrug resistant coliform bacteria and pseudomonads
