Paleoclimatology Oxford Monographs On Geology And Geophysics:

Paleoclimatology Thomas J. Crowley, Gerald R. North, 1996 Paleoclimatology is a review of the history of the Earth's climate from the time of its formation four and a half billion years ago to the present. The field according to John Imbrie a leading paleontologist at Brown University is ripe for synthesis with broad implications in geology, geophysics, geochemistry, oceanography and the atmospheric sciences. This book addresses several topics rarely discussed in paleoclimate summaries including the modeling of Paleozoic climates and the environmental consequences of asteroid impacts. In addition, the book identifies areas for future research and offers a frame of reference for interpreting the likely consequences of greenhouse warming. A new chapter has been added updating the information since 1991. **Paleoclimatology** Colin P.

Summerhayes, 2020-06-22 Life on our planet depends upon having a climate that changes within narrow limits not too hot for the oceans to boil away nor too cold for the planet to freeze over. Over the past billion years Earth's average temperature has stayed close to 14-15°C oscillating between warm greenhouse states and cold icehouse states. We live with variation but a variation with limits. Paleoclimatology is the science of understanding and explaining those variations, those limits and the forces that control them. Without that understanding we will not be able to foresee future change accurately as our population grows. Our impact on the planet is now equal to a geological force such that many geologists now see us as living in a new geological era, the Anthropocene. Paleoclimatology describes Earth's passage through the greenhouse and icehouse worlds of the past 800 million years including the glaciations of Snowball Earth in a world that was then free of land plants. It describes the operation of the Earth's thermostat which keeps the planet fit for life and its control by interactions between greenhouse gases, land plants, chemical weathering, continental motions, volcanic activity, orbital change and solar variability. It explains how we arrived at our current understanding of the climate system by reviewing the contributions of scientists since the mid 1700s showing how their ideas were modified as science progressed. And it includes reflections based on the author's involvement in palaeoclimatic research. The book will transform debate and set the agenda for the next generation of thought about future climate change. It will be an invaluable course reference for undergraduate and postgraduate students in geology, climatology, oceanography and the history of science. A real tour de force. An outstanding summary not only of the science and what needs to be done but also the challenges that are a consequence of psychological and cultural baggage that threatens not only the survival of our own species but the many others we are eliminating as well. Peter Barrett, Emeritus Professor of Geology, Antarctic Research Centre, Victoria University of Wellington, New Zealand. What a remarkable and wonderful synthesis; it will be a wonderful source of paleoclimate information and insights. Christopher R. Scotese, Professor, Department of Earth and Planetary Sciences, Northwestern University, Evanston, IL, USA. [The Climate of Past Interglacials](#) F. Sirocko, M. Claussen, T. Litt, M.F. Sanchez-Goni, 2006-12-08 Historically, climate fluctuations such as the Little Ice Age show that interglacial climate change is not entirely stable but responds to even subtle changes in radiative forcing. Through

research it has been made clear that even an abrupt change of climate within years is not just a theoretical possibility but has in fact happened in the prehistoric past It is therefore clear that in principal it could happen again Human civilaization has exploded under the mild and relatively stable climatic conditions that have prevailed over the last 11 000 years This book focuses on revisiting the past and to study climate and environment in a suite of experiments where boundary conditions are similar but not identical to today so we can learn about the climate environment system its sensitivity thresholds and feedback The palaeoclimate community holds an important key to scientific information on climate change that provides a basis for appropriate adaptation and mitigation strategies The authors of this book have taken up this challenge and summarize their results in this special volume It presents state of the art science on new reconstructions from all spheres of the Earth System and on their synthesis on methodological advances and on the current ability of numerical models to simulate low and high frequency changes of climate environment and chemical cycling related to interglacials Summarizes important information on climate change providing a basis for appropriate adaptation and mitigation strategies for human civilization Reports on new reconstuctions on methodological advances numerical models simulating low and high frequency changes and chemical cycling related to interglacials Incorporates palaeovegetaion and numerical modeling of climate and environmental and geochemical parameters to address regional feedback to global change with successful data models

Late Cretaceous and Cenozoic History of North American Vegetation Alan Graham,1999-03-25 This book is a unique and integrated account of the history of North American vegetation and paleoenvironments over the past 70 million years It includes discussions of the modern plant communities causal factors for environmental change biotic response and methodologies The history reveals a North American vegetation that is vast immensely complex and dynamic **The Cretaceous-Tertiary Event and Other Catastrophes in Earth History** Graham Ryder,David E. Fastovsky,Stefan Gartner,1996-01-01 This volume atempts to explore and clarify the relationship among the geological records the extinctions and the causes of catastrophes for life in Earth s history Most of the papers address the geological record and the extinctions across the Cretaceou Tertiary boundary and the buried Chicxulub structure that is now consensually deemed to be of impact origin and to be intimately related to that boundary GSA website **Computerized Modeling of Sedimentary Systems**

Jan Harff,Wolfram Lemke,Karl Stattegger,2013-03-14 Computerized modeling is a powerful tool to describe the complex interrelations between measured data and the dynamics of sedimentary systems Complex interaction of environmental factors with natural variations and increasing anthropogenic intervention is reflected in the sedimentary record at varying scales The understanding of these processes gives way to the reconstruction of the past and is a key to the prediction of future trends Especially in cases where observations are limited and or expensive computer simulations may substitute for the lack of data State of the art research work requires a thorough knowledge of processes at the interfaces between atmosphere hydrosphere biosphere and lithosphere and is therefore an interdisciplinary approach *Elements of Physical*

Summerhayes, 2015-07-13 To understand climate change today we first need to know how Earth's climate changed over the past 450 million years Finding answers depends upon contributions from a wide range of sciences not just the rock record uncovered by geologists In *Earth's Climate Evolution* Colin Summerhayes analyzes reports and records of past climate change dating back to the late 18th century to uncover key patterns in the climate system The book will transform debate and set the agenda for the next generation of thought about future climate change The book takes a unique approach to the subject providing a description of the greenhouse and icehouse worlds of the past 450 million years since land plants emerged ignoring major earlier glaciations like that of Snowball Earth which occurred around 600 million years ago in a world free of land plants It describes the evolution of thinking in palaeoclimatology and introduces the main players in the field and how their ideas were received and in many cases subsequently modified It records the arguments and discussions about the merits of different ideas along the way It also includes several notes made from the author's own personal

involvement in palaeoclimatological and palaeoceanographic studies and from his experience of working alongside several of the major players in these fields in recent years This book will be an invaluable reference for both undergraduate and postgraduate students taking courses in related fields and will also be of interest to historians of science and or geology climatology and oceanography It should also be of interest to the wider scientific and engineering community high school science students policy makers and environmental NGOs Reviews Outstanding in its presentation of the facts and a good read in the way that it intersperses the climate story with the author s own experiences This book puts the climate story into a compelling geological history Dr James Baker The book is written in very clear and concise prose and takes original enlightening and engaging approach to talking about ideas from the perspective of the scientists who promoted them Professor Christopher R Scotese A thrilling ride through continental drift and its consequences Professor Gerald R North Written in a style and language which can be easily understood by laymen as well as scientists Professor Dr J rn Thiede What makes this book particularly distinctive is how well it builds in the narrative of change in ideas over time Holocene book reviews May 2016 This is a fascinating book and the author s biographical approach gives it great human appeal E Adlard
