Saving Ourselves from Big Car David Obst, 2025-09-16 Cars are killing people and making the planet uninhabitable Crashes take the lives of more than a million people around the world each year Air pollution linked to motor vehicles contributes to even more untimely deaths Highways and unsafe streets have devastated cities yet traffic congestion still swallows up countless hours And carbon emissions from transportation are a key driver of climate change which now threatens to make the world unlivable Why do we still worship at the altar of the car How can we find alternatives that are healthier for the planet and ourselves This book exposes how Big Car the complex of companies in the automobile oil insurance media and concrete industries that promote and entrench car dependence has pursued profit at the expense of the common good David Obst explores how Big Car gained almost immeasurable influence over our lives weighing the benefits and the costs of reliance on private automobiles He details how industry covered up the harms of lead additives fought against seatbelts and continues to fund climate change denialism Obst considers the future of mobility surveying how cities from Taipei to Tempe Copenhagen to Chicago are experimenting with forms of transportation that offer alternatives to the dominance of cars Provocative and comprehensive Saving Ourselves from Big Car is a powerful wake up call for us to change how we use cars before it's too late

Advances in Understanding Thermal Effects in Rubber Gert Heinrich, Reinhold Kipscholl, Jean-Benoît Le Cam, Radek Stoček, 2024-09-10 In the case of an ideal rubber one often thinks of the linear dependence of the shear modulus on temperature as an expression of the typical entropy elasticity However temperature dependencies of typical technical rubber materials are known to be much more complicated This has consequences for the practical behaviour of rubber elastic components One well known instance of this is the dramatic Challenger disaster The rubber used to seal the solid rocket booster joints with O rings did not expand at temperatures of 0 C or below resulting in an opening in the solid rocket booster joint through which gas attempted to escape The main physical reason for the heat generation processes is the hysteresis of rubber materials due to deformation and viscoelasticity Most elastomers therefore change significantly over time when exposed to heat and likewise light or oxygen ozone These changes can have a dramatic effect on the life and properties of the elastomers Heat development in a rubber occurs when it is subjected to a variety of compressive stresses in service Heat evolution tests are commonly performed to estimate the quality of use and expected service life of various compounds or material options for end product applications New developments in recent years on test methods in this direction constitute an important part of the book At the same time corresponding simulation and modelling methods have been developed that contribute to a better understanding and enable the predictive simulation of self heating and the kinetics of temperature fields in complex cyclically loaded rubber components Specifically finite strain thermal viscoelastic damage models for predicting the cyclic thermomechanical response of rubber specimens under fatigue are also presented and analytical models for heat diffusion in stressed rubbers
