Cigliano, Heidi L. Ballard, 2017-10-31 In recent years citizen science has emerged as a powerful new concept to enable the general public students and volunteers to become involved in scientific research A prime example is in biodiversity conservation where data collection and monitoring can be greatly enhanced through citizen participation This is the first book to provide much needed guidance and case studies from marine and coastal conservation The novelty and rapid expansion of the field has created a demand for the discussion of key issues and the development of best practices The book demonstrates the utility and feasibility as well as limitations of using marine and coastal citizen science for conservation and by providing critical considerations i e which questions and systems are best suited for citizen science presents recommendations for best practices for successful marine and coastal citizen science projects A range of case studies for example on monitoring of seabird populations invasive species plastics pollution and the impacts of climate change from different parts of the world is included Also included are discussions on engaging youth indigenous communities and divers and snorkelers as citizen scientists as well as best practices on communication within citizen science building trust with stakeholders and informing marine policy as part of this exciting and empowering way of improving marine and coastal conservation

Digital innovation in citizen science to enhance water quality monitoring in developing countries

Pattinson, N. B., Taylor, J., Dickens, Chris W. S., Graham, P. M., 2023-12-31 Freshwater systems are disproportionately adversely affected by the ongoing global environmental crisis The effective and efficient water resource conservation and management necessary to mitigate the crisis requires monitoring data especially on water quality This is recognized by Sustainable Development Goal SDG 6 particularly indicator 6.3.2 which requires all UN member states to measure and report the proportion of water bodies with good ambient water quality However gathering sufficient data on water quality is reliant on data collection at spatial and temporal scales that are generally outside the capacity of institutions using conventional methods Digital technologies such as wireless sensor networks and remote sensing have come to the fore as promising avenues to increase the scope of data collection and reporting Citizen science which goes by many names e g participatory science or community based monitoring has also been earmarked as a powerful mechanism to improve monitoring However both avenues have drawbacks and limitations The synergy between the strengths of modern technologies and citizen science presents an opportunity to use the best features of each to mitigate the shortcomings of the other This paper briefly synthesizes recent research illustrating how smartphones sometimes in conjunction with other sensors present a nexus point method for citizen scientists to engage with and use sophisticated modern technology for water quality monitoring This paper also presents a brief non exhaustive research synthesis of some examples of current technological upgrades or innovations regarding smartphones in citizen science water quality monitoring in developing countries and how these can assist in objective comprehensive and improved data collection management and reporting While digital innovations are being rapidly developed worldwide there remains a paucity of scientific and socioeconomic

validation of their suitability and usefulness within citizen science This perhaps contributes to the fact that the uptake and upscaling of smartphone assisted citizen science continues to underperform compared to its potential within water resource management and SDG reporting Ultimately we recommend that more rigorous scientific research efforts be dedicated to exploring the suitability of digital innovations in citizen science in the context of developing countries and SDG reporting
