Aspect-Oriented, Model-Driven Software Product Lines Awais Rashid, Jean-Claude Royer, Andreas Rummeler, 2011-09-08. Software product lines provide a systematic means of managing variability in a suite of products. They have many benefits, but there are three major barriers that can prevent them from reaching their full potential. First, there is the challenge of scale: a large number of variants may exist in a product line context, and the number of interrelationships and dependencies can rise exponentially. Second, variations tend to be systemic by nature in that they affect the whole architecture of the software product line. Third, software product lines often serve different business contexts, each with its own intricacies and complexities. The AMPLE (<http://www.ample-project.net>) approach tackles these three challenges by combining advances in aspect-oriented software development and model-driven engineering. The full suite of methods and tools that constitute this approach are discussed in detail in this edited volume and illustrated using three real-world industrial case studies.

Smart Homes and Health Telematics Abdelsalam (Sumi) Helal, Simanta Mitra, Johnny Wong, Carl K. Chang, Mokhtari Mounir, 2008-06-21. We often conceptualize that older adults retire into a life of carefree luxury among palm trees, golf courses, and pristine beaches. Unfortunately, reality differs: today many retire in place, and often it is the case they retire in rural areas far from hospitals and care-giving centers. For instance, over half of the older population in the state of Minnesota lives in small towns away from the center of care, which is Minneapolis-St. Paul. This year, ICOST 2008 aimed at focusing on this important reality and on gerontechnology: the use of technology to enhance the quality of life of older adults in rural lands. We had a strong technical program this year, spanning many critical topics including remote monitoring and telecare, access control, and privacy preservation; understanding user requirements and needs; autonomous learning and reasoning about user behavior, activities, and contexts; user interface design; middleware for sensing and actuation in smart homes; cognitive assistants; context-aware service provisioning, among other topics. We received a total of 54 submissions of papers, abstracts, and posters from 14 different countries. Through a blind review process, we accepted 24 full papers, 9 abstracts, and 7 posters. Each submission received two or three reviews, with the exception of a few that received four reviews. We are

thankful to all the reviewers who helped in the review process including members of the Technical Committee and the additional reviewers that we needed to compensate for unreturned reviews
