Multimodality Imaging in Cardiovascular Disease Karen S.L. Teo,2007 The non invasive cardiovascular imaging modalities cardiovascular magnetic resonance CMR and multi detector computer tomography MDCT are playing an increasing role in both clinical and research settings CMR is a unique imaging modality due to unsurpassed contrast between soft tissue structures that is non invasive does not use ionising radiation and is able to provide high resolution information about cardiac anatomy function flow perfusion viability and metabolism MDCT has been used in clinical settings to measure of the amount of calcification in the coronary arteries with coronary artery calcium scoring of the coronary tree a surrogate marker of atherosclerosis In this thesis our aims were to address some specific novel areas advancing the utility of these imaging modalities in two major areas of interest namely congenital heart disease and atheroma imaging Our first step was to validate the accuracy and reproducibility of CMR the main imaging modality we utilised To achieve this we assessed MR imaging of cardiac volumes and function in a normal adult Australian population with a specific focus on the reproducibility of the technique Thus in summary we have been able to confirm the accuracy and reproducibility of CMR and MDCT in the areas of a specific congenital defect ASD and atherosclerosis imaging and utilised these techniques to advance our understanding of these disease states This thesis identifies strengths and weaknesses of these techniques that will allow us to more appropriately use them for future purposes in cardiovascular disease
