Growth Factors and Cytokines in Skeletal Muscle Development, Growth, Regeneration and Disease Jason White, Gayle Smythe, 2016-03-22 This book describes the diverse roles that growth factors and cytokines play in skeletal muscle The extracellular environment has profound effects on the biology of skeletal muscle The soluble portion of this environment includes a rich milieu of growth factors and cytokines which have been shown to regulate virtually all facets of the response of skeletal muscle to external stimuli whether it be exercise induced metabolic shifts remodeling in response to trauma or loading of the ongoing pathology associated with neuromuscular disease The chapters included in this work illustrate growth factors that directly affect skeletal muscle cells and those which influence non muscle cells that contribute to the biology of skeletal muscle as a whole tissue The current state of the art with the advent of systems biology allows for the delineation of signaling networks which are regulated by suites of growth factors This is in stark contrast to early more traditional studies which only examined the effects of isolated growth factors on the activity of skeletal muscle precursor cells in tissue culture The work presented in this volume ranges from reviewing and analyzing the roles of individual growth factors in detail to the complex interplay of multiple soluble factors in the control of muscle functional and dysfunctional states The material covered in this volume will particularly suit readers from a range of research fields spanning general muscle biology and physiology and those working on diseases and conditions affecting skeletal muscle both directly and indirectly

Role

of Stem Cells in Skeletal Muscle Development, Regeneration, Repair, Aging and Disease Pura Muñoz-Cánoves,Jaime J. Carvajal,Adolfo Lopez de Munain,Ander Izeta,2016-06-29 Adult stem cells are responsible for tissue regeneration and repair throughout life Their quiescence or activation are tightly regulated by common signalling pathways that often recapitulate those happening during embryonic development and thus it is important to understand their regulation not only in postnatal life but also during foetal development In this regard skeletal muscle is an interesting tissue since it accounts for a large percentage of body mass about 40% it is highly amenable to intervention through exercise and it is also key in metabolic and physiological changes underlying frailty susceptibility in the elderly While muscle resident satellite cells are responsible for all myogenic activity in physiological conditions and become senescent in old age other progenitor cells such as mesoangioblasts do seem to contribute to muscle regeneration and repair after tissue damage Similarly fibro adipogenic precursor cells seem to be key in the aberrant response that fills up the space left from atrophied muscle mass and which ends up with a dysfunctional muscle having vast areas of fatty infiltration and fibrosis The complex interplay between these stem progenitor cell types and their niches in normal and pathological conditions throughout life are the subjects of intense investigation This eBook highlights recent developments on the role of stem cells in skeletal muscle function both in prenatal and postnatal life and their regulation by transcriptional post transcriptional and epigenetic mechanisms Additionally it includes articles on interventions associated with exercise pathological changes in neuromuscular diseases and stem cell aging

Signalling Pathways in Embryonic Development Juan J. Sanz-Ezquerro,Andrea E. Münsterberg,Sigmar Stricker,2017-11-30 The formation of a complex multicellular organism from a single cell is one of the most amazing processes of biology Embryonic development is characterised by the careful regulation of cellular behaviours such that cells proliferate migrate differentiate and form tissues at the correct place and time These processes are genetically controlled and depend both on the history of cells their lineage and on the activities of signalling pathways which coordinate the cell interactions leading to organogenesis The aim of the Frontiers research topic Signalling pathways in embryonic development has been to provide a forum for experts in cell and developmental biology to share recent advances in the field of signalling during embryonic development Sixteen articles in a variety of formats are united in this Topic offering a valuable collection for researchers looking for an update in the knowledge of signalling pathways operating during embryogenesis The works focused mainly on vertebrates explore different aspects of this theme from cell communication to organ formation and have implications for areas as distant as evolution or pathology Understanding developmental signalling pathways is important for several reasons It gives us information about basic mechanisms of cell function and interactions needed for morphogenesis and organogenesis It uncovers the basis of congenital malformations since errors at any step of cell signalling during development are a major cause of defects This fundamental insight gives us clues to understand the mechanisms operating in evolution that explain diversity in form and function And finally it allows the identification of possible causes of disease in the

adult organism such as cancer or degenerative diseases pinpointing possible targets for therapeutic approaches
