Environmental Contaminants Tariq Aftab, 2022-11-04 Environmental contaminants are chemicals that accidentally or deliberately enter the environment often but not always as a result of human activities Some of these contaminants may have

been manufactured for industrial use and because they are very stable they do not break down easily. If released to the environment, these contaminants may enter the food chain. Other environmental contaminants are naturally occurring chemicals, but industrial activity may increase their mobility or increase the amount available to circulate in the environment, allowing them to enter the food chain at higher levels than would otherwise occur. Environmental contaminants influence the physiological cell reactions at different and heterogeneous basics and lead to altering in normal cell function primarily at the molecular and biochemical level. Molecular responses to such common environmental stresses have been studied intensively over the last few years in which there is an intricate network of signaling pathways controlling perception of these environmental stress signals, the generation of second messengers and signal transduction. Recent advances in many areas of plant and microbial research, including genotyping, make scientists optimistic that valuable solutions will be found to allow deployment commercialization of strategies better able to tolerate these environmental stresses. Environmental remediation was historically viewed as an inherently sustainable activity as it restores contamination; however, researchers and practitioners are increasingly recognizing that there can be substantial environmental footprints and socioeconomic costs associated with remediation. Sustainability is an imperative in the emerging green and sustainable remediation movement which is reshaping the entire remediation industry. Understanding the significant roles of sustainable or eco friendly approaches in mitigating environmental contaminants, the current subject has recently attracted the attention of scientists from across the globe. This comprehensive volume, *Sustainable Management of Environmental Contaminants: Eco friendly Remediation Approaches*, highlights the various prospects involved in current scenario. The current volume comprises the chapters from diverse areas dealing with biotechnology, microbial technology, nanotechnology, molecular biology, green and sustainable remediation etc. I am hopeful that this volume will furnish the requisite of all those who are working or have interest in the current topic.

Mushroom Biology: Concise Basics And Current Developments Shu-ting Chang, Philip G Miles, 1997-06-01. The discipline of Mushroom Biology created by the authors of this book has now been legitimized by references in the scientific literature and by two International Conferences devoted to the subject. This book sets the parameters of Mushroom Biology in a concise manner and also emphasizes trends and points out future directions which will lead to a greater utilization of mushrooms and mushroom products. The discipline was established to bring together persons who have in common scientific or commercial interests involving mushrooms. The authors' definition of mushroom is more broad than the usual mycological definition so that macrofungi other than Basidiomycetes can be included. Mushrooms may be edible, non edible, poisonous or medicinal species with hypogeous or epigeous fruiting bodies and their texture may be fleshy or non fleshy. Many aspects of Mushroom Biology are presented including nutritional and medicinal uses, the role of mushrooms in bioremediation, biotechnology and in the bioconversion of waste organic materials into forms that can enter the major nutrient cycles. Basic scientific studies involving mushroom species are also considered with an emphasis on
