Computational Methods for Fracture Timon Rabczuk, 2019-10-28 This book offers a collection of 17 scientific papers about the computational modeling of fracture Some of the manuscripts propose new computational methods and or how to improve existing cutting edge methods for fracture These contributions can be classified into two categories 1 Methods which treat the crack as strong discontinuity such as peridynamics scaled boundary elements or specific versions of the smoothed finite element methods applied to fracture and 2 Continuous approaches to fracture based on for instance phase field models or continuum damage mechanics On the other hand the book also offers a wide range of applications

where state of the art techniques are employed to solve challenging engineering problems such as fractures in rock glass concrete Also larger systems such as fracture in subway stations due to fire arch dams or concrete decks are studied

Handbook of Structural Life Assessment Raouf A. Ibrahim, 2017-03-29 This important self contained reference deals with structural life assessment SLA and structural health monitoring SHM in a combined form SLA periodically evaluates the state and condition of a structural system and provides recommendations for possible maintenance actions or the end of structural service life It is a diversified field and relies on the theories of fracture mechanics fatigue damage process and reliability theory For common structures their life assessment is not only governed by the theory of fracture mechanics and fatigue damage process but by other factors such as corrosion grounding and sudden collision On the other hand SHM deals with the detection prediction and location of crack development online Both SLA and SHM are combined in a unified and coherent treatment

Numerical Simulation of Thermo-elasticity, Inelasticity and Rupture in Membrane Theory Michael James Taylor,2008 **Peridynamic Theory for Modeling Three-Dimensional Damage Growth in Metallic and Composite Structures** Erkan Oterkus,2010 A recently introduced nonlocal peridynamic theory removes the obstacles present in classical continuum mechanics that limit the prediction of crack initiation and growth in materials It is also applicable at different length scales This study presents an alternative approach for the derivation of peridynamic equations of motion based on the principle of virtual work It also presents solutions for the longitudinal vibration of a bar subjected to an initial stretch propagation of a pre existing crack in a plate subjected to velocity boundary conditions and crack initiation and growth in a plate with a circular cutout Furthermore damage growth in composites involves complex and progressive failure modes Current computational tools are incapable of predicting failure in composite materials mainly due to their mathematical structure However the peridynamic theory removes these obstacles by taking into account non local interactions between material points Hence an application of the peridynamic theory to predict how damage propagates in fiber reinforced composite materials subjected to mechanical and thermal loading conditions is presented Finally an analysis approach based on a merger of the finite element method and the peridynamic theory is proposed Its validity is established through qualitative and quantitative comparisons against the test results for a stiffened composite curved panel with a central slot under combined internal pressure and axial tension The predicted initial and final failure loads as well as the final failure modes are in close agreement with the experimental observations This proposed approach demonstrates the capability of the PD approach to assess the durability of complex composite structures **Program and Abstracts for the**
