

## Making Right and Left Turns

Check for traffic and pedestrians. Search mirrors when making any braking action. Signal five seconds before the turn.

1. Position your vehicle in the correct lane for the turn.

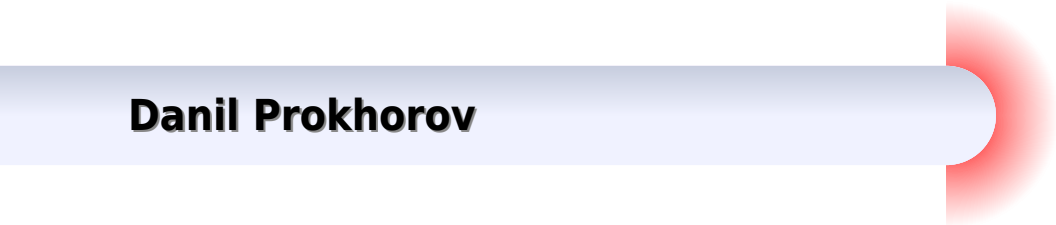

For a right turn, use lane position 3 if there are no parked vehicles.

For a left turn, use lane position 2, the lane nearest the center line. (On a one-way street, this could be in the far left lane.)

daily living Another research area where lab based movement assessments have led to conflicting findings is the field of sports injury prevention Many neuromuscular training programs have been shown to be effective in reducing the sport injury rate in athletes by 30 50% or more in a variety of different multi directional sports Nevertheless lab based assessments of the same athletes who completed those training programs were often not able to detect improvements in motor control of sport specific movements or a reduction in joint loading two factors thought to be closely linked with sport injury risk This disconnect suggests that lab based assessments of movement and motor control are often poor indicators of player behavior during real game scenarios and may limit our ability to screen athletes for injury risk or monitor their progress in rehabilitation These examples highlight that we should strive for the assessment and investigation of human movement and motor control in natural environments i e where individuals patients athletes or other groups of interest perform explore and interact under real world conditions

**Advances in Human Aspects of Transportation: Part II** Neville Stanton, Steven Landry, Giuseppe Di Bucchianico, Andrea Vallicelli, 2021-07-19 Human Factors and Ergonomics have made a considerable contribution to the research design development operation and analysis of transportation systems which includes road and rail vehicles and their complementary infrastructure aviation and maritime transportation This book presents recent advances in the Human Factors aspects of Transportation These advances include accident analysis automation of vehicles comfort distraction of drivers understanding of distraction and how to avoid it environmental concerns in vehicle systems design intelligent transport systems methodological developments new systems and technology observational and case studies safety situation awareness skill development and training warnings and workload This book brings together the most recent human factors work in the transportation domain including empirical research human performance and other types of modeling analysis and development The issues facing engineers scientists and other practitioners of human factors in transportation research are becoming more challenging and more critical The common theme across these sections is that they deal with the intersection of the human and the system Moreover many of the chapter topics cross section boundaries for instance by focusing on function allocation in NextGen or on the safety benefits of a tower controller tool This is in keeping with the systemic nature of the problems facing human factors experts in rail and road aviation and maritime research it is becoming increasingly important to view problems not as isolated issues that can be extracted from the system environment but as embedded issues that can only be understood as a part of an overall system
