Monoidal Topology Dirk Hofmann, Gavin J. Seal, Walter Tholen, 2014-07-31 Monoidal Topology describes an active research area that after various past proposals on how to axiomatize spaces in terms of convergence began to emerge at the beginning of the millennium. It combines Barr's relational presentation of topological spaces in terms of ultrafilter convergence with Lawvere's interpretation of metric spaces as small categories enriched over the extended real half line. Hence equipped with a quantale V replacing the reals and a monad T replacing the ultrafilter monad, laxly extended from set maps to V -valued relations, the book develops a categorical theory of T - V algebras that is inspired simultaneously by its metric and topological roots. The book highlights in particular the distinguished role of equationally defined structures within the given lax algebraic context and presents numerous new results ranging from topology and approach theory to domain theory. All the necessary prerequisites in order and category theory are presented in the book. *Index Analysis* R.

Lowen, 2015-01-06 The featured review of the AMS describes the author's earlier work in the field of approach spaces as a landmark in the history of general topology. In this book the author has expanded this study further and taken it in a new and exciting direction. The number of conceptually and technically different systems which characterize approach spaces is increased and moreover their uniform counterpart uniform gauge spaces is put into the picture. An extensive study of completions both for approach spaces and for uniform gauge spaces as well as compactifications for approach spaces is performed. A paradigm shift is created by the new concept of index analysis. Making use of the rich intrinsic quantitative information present in approach structures, a technique is developed whereby indices are defined that measure the extent to which properties hold and theorems become inequalities involving indices, therefore vastly extending the realm of applicability of many classical results. The theory is then illustrated in such varied fields as topology, functional analysis, probability theory, hyperspace theory, and domain theory. Finally, a comprehensive analysis is made concerning the categorical aspects of the theory and its links with other topological categories. *Index Analysis* will be useful for mathematicians working in category theory, topology, probability, and statistics, functional analysis, and theoretical computer science. Applied Semantics

Gilles Barthe, Peter Dybjer, Luis Pinto, João Saraiva, 2003-08-02 This book is based on material presented at the international summer school on Applied Semantics that took place in Caminha, Portugal, in September 2000. We aim to present some recent developments in programming language research both in semantic theory and in implementation in a series of graduate level lectures. The school was sponsored by the ESPRIT Working Group 26142 on Applied Semantics (APPSEM), which operated between April 1998 and March 2002. The purpose of this working group was to bring together leading researchers both in semantic theory and in implementation with the specific aim of improving the communication between theoreticians and practitioners. The activities of APPSEM were structured into nine interdisciplinary themes: A Semantics for object oriented programming, B Program structuring, C Integration of functional languages and proof assistants, D Verification

methods E Automatic program transformation F Games sequentiality and abstract machines G Types and type inference in programming H Semantics based optimization I Domain theory and real number computation These themes were identified as promising for profitable interaction between semantic theory and practice and were chosen to contribute to the following general topics description of existing programming language features design of new programming language features implementation and analysis of programming languages transformation and generation of programs verification of programs The chapters in this volume give examples of recent developments covering a broad range of topics of interest to APPSEM

Non-Hausdorff Topology and Domain Theory Jean Goubault-Larrecq, 2013-03-28 This unique book on modern topology looks well beyond traditional treatises and explores spaces that may but need not be Hausdorff This is essential for domain theory the cornerstone of semantics of computer languages where the Scott topology is almost never Hausdorff For the first time in a single volume this book covers basic material on metric and topological spaces advanced material on complete partial orders Stone duality stable compactness quasi metric spaces and much more An early chapter on metric spaces serves as an invitation to the topic continuity limits compactness completeness and forms a complete introductory course by itself Graduate students and researchers alike will enjoy exploring this treasure trove of results Full proofs are given as well as motivating ideas clear explanations illuminating examples application exercises and some more challenging problems for more advanced readers
