Induced Resistance: Interactive Effects for Improving Crop Health Debasis Mitra, Bahman Khoshru, Anju Rani, Edappayil Janeeshma, 2025-06-02 The current population of the Earth which is approximately 7.88 billion is projected to reach 9.8 billion by the year 2050 In order to accommodate this growth it is crucial that we prepare for the increased demand for food However the agricultural industry continues to rely heavily on chemical fertilizers pesticides and herbicides These practices have severe environmental consequences leading to a decline in the diversity of soil microorganisms which can ultimately harm food production This situation is further complicated by climate change deteriorating soil health and other stressors Here microbial mediated induced resistance MIR is an intriguing area of study in agriculture that explores the potential of microbes to sustain plant resistance to pathogens This methodology utilizes specific microorganisms including bacteria and fungi to trigger a systemic response in plants thus enhancing their defense mechanisms against disease The impact of MIR on crop health can be substantial and provide sustainable alternatives to conventional chemical based techniques for disease management Advancing research into the study of microbes in sustainable agriculture will generate interest in adopting novel methods that increase crop yield soil health and fertility Through this Research Topic we aim to showcase the most recent insights about plant soil microbes which play a significant role in microbial mediated induced resistance Specifically we are interested in the rhizospheric soil dynamics and nutrient acquisition contributing to plant growth and development Soil microbes are crucial for plant nutrient uptake inducing Induced Systemic Resistance and managing stressful climatic conditions through plant signaling compounds and crosstalk mechanisms Beneficial symbiotic
