Mediated Modeling A System Dynamics Approach To Environmental Consensus Building:

Mediated Modeling Marjan Van den Belt, 2004-04 Mediated modeling is an innovative new approach that enhances the use of computer models as invaluable tools to guide policy and management decisions Rather than having outside experts dispensing answers to local stakeholders mediated modeling brings together diverse interests to raise the shared level of understanding and foster a broad and deep consensus It provides a structured process based on system dynamics thinking in which community members government officials industry representatives and other stakeholders can work together to produce a coherent simple but elegant simulation model Mediated Modeling by Marjan Van Den Belt is a practical guide to participatory modeling for both practitioners and students one that is firmly theoretically grounded in the field of systems dynamics and environmental modeling Five in depth case studies describe the successful use of the technique in a variety of settings and a final chapter synthesizes the lessons highlighted by the case studies Mediated Modeling s step by step description of the techniques and practical advice regarding implementation offer a real world solution for all those seeking to make sound decisions about the environment

Agent-Based Modeling of Environmental Conflict and Cooperation Todd BenDor, Jürgen Scheffran, 2018-10-12 Conflict is a major facet of many environmental challenges of our time However growing conflict complexity makes it more difficult to identify win win strategies for sustainable conflict resolution Innovative methods are needed to help predict understand and resolve conflicts in cooperative ways Agent Based Modeling of Environmental Conflict and Cooperation examines computer modeling techniques as an important set of tools for assessing environmental and resource based conflicts and ultimately for finding pathways to conflict resolution and cooperation This book has two major goals First it argues that complexity science can be a unifying framework for professions engaged in conflict studies and resolution including anthropology law management peace studies urban planning and geography Second this book presents an innovative framework for approaching conflicts as complex adaptive systems by using many forms of environmental analysis including system dynamics modeling agent based modeling evolutionary game theory viability theory and network analysis Known as VIABLE Values and Investments from Agent Based interaction and Learning in Environmental systems this framework allows users to model advanced facets of conflicts including institution building coalition formation adaptive learning and the potential for future conflict and conflict resolution based on the long term viability of the actors strategies Written for scholars students practitioners and policy makers alike this book offers readers an extensive introduction to environmental conflict research and resolution techniques As the result of decades of research the text presents a strong argument for conflict modeling and reviews the most popular and advanced

techniques including system dynamics modeling agent based modeling and participatory modeling methods This indispensable guide uses NetLogo a widely used and free modeling software package to implement the VIABLE modeling approach in three case study applications around the world Readers are invited to explore adapt modify and expand these models to conflicts they hope to better understand and resolve

applications of a variety of modeling methodologies have multiplied in recent decades due to widespread recognition of the power of models to integrate information from multiple sources test assumptions about policy and management choices and forecast the future states of complex systems However information about these modeling efforts often is segregated by both discipline and modeling approach preventing modelers from learning from one another This volume addresses the need for cross disciplinary and cross methodological communication about collaborative modeling To enhance a shared understanding of systems problems scientists and stakeholders need strategies for integrating information from their respective fields dealing with issues of scale and focus and rigorously investigating assumptions The chapters in this volume first explore modeling methodologies for enhanced collaboration then offer case studies of collaborative modeling across different complex systems problems The volume will be useful for experienced and beginning modelers as well as scientists and stakeholders who work with modelers

The Coastal Everglades Daniel L. Childers, Evelyn Gaiser, Laura A. Ogden, 2019-09-25 The Coastal Everglades presents a broad overview and synthesis of research on the coastal Everglades a region that includes Everglades National Park adjacent managed wetlands and agricultural and urbanizing communities Contributors for this volume are all collaborators on the Florida Coastal Everglades Long Term Ecological Research Program FCE LTER The FCE LTER began in 2000 with a focus on understanding key ecosystem processes in the coastal Everglades while also developing a platform for and linkages to related

work conducted by an active and diverse Everglades research community. The program is based at Florida International University in Miami but includes scientists and students from numerous other universities as well as staff scientists at key resource management agencies including Everglades National Park and the South Florida Water Management District. Though the Everglades landscape spans nearly a third of the State of Florida, the focus on the coastal Everglades has allowed the contributors to examine key questions in social ecological science in the context of ongoing restoration initiatives. As this book demonstrates, the long term research of the FCE LTER has facilitated a better understanding of the roles of sea level rise, water management practices, urban and agricultural development, and other disturbances such as fires and storms on the past and future dynamics of this unique coastal environment. By comparing properties of the Everglades with other subtropical and tropical wetlands, the book challenges ideas of novelty while revealing properties of ecosystems at the ends of gradients that are often ignored. It also provides insights from and encouragement for long term collaborative studies that inform resource management in similarly threatened coastal wetland landscapes.
