Hui, Frank Sherkat,2005-12-19 Advances in food science technology and engineering are occurring at such a rapid rate that obtaining current detailed information is challenging at best While almost everyone engaged in these disciplines has accumulated a vast variety of data over time an organized comprehensive resource containing this data would be invaluable to have The *Technology of Dairy Products* Ralph Early,1998 This second revised edition of The technology of dairy products continues to explain methods of milk product manufacture the technology involved and how other influences affect finished products

*Handbook of Drying for Dairy Products* C. Anandharamakrishnan, 2017-02-03 Handbook of Drying for Dairy Products is a complete guide to the field's principles and applications with an emphasis on best practices for the creation and preservation of dairy-based food ingredients. Details the techniques and results of drum drying, spray drying, freeze drying, spray freeze drying, and hybrid drying. Contains the most up-to-date research for optimizing the drying of dairy as well as computer modelling options. Addresses the effect of different drying techniques on the nutritional profile of dairy products. Provides essential information for dairy science academics as well as technologists active in the dairy industry. Milk and Milk Products Alan H. Varnam, 2012-12-06 Milk has been an important food for man since the domestication of cattle and the adoption of a pastoralist agriculture. It is also the most versatile of the animal-derived food commodities and is a component of the diet in many physical forms. In addition to milk itself, a rural technology evolved which permitted the manufacture of cheese, fermented milks, cream, and butter. At a later date, successive advances in technology were exploited in the manufacture of ice cream, concentrated and dried milks, and at a later date of ultra-heat-treated dairy products, new dairy desserts, and new functional products. At the same time, however, dairy products have been increasingly perceived as unhealthy foods, and a number of high-quality dairy substitutes or analogues have been developed which have made significant inroads into the total dairy food market. Paradoxically, perhaps, the technology which on the one hand presents a threat to the dairy industry through making possible high-quality substitutes, offers on the other hand an opportunity to exploit new uses for milk and its components and to develop entirely new dairy products. Further, the development of products such as low-fat dairy spreads has tended to blur the distinction between the dairy industry and its imitators and further broadened the range of knowledge required of dairy scientists and technologists. **Education and Training in Food Science** Ian Douglas Morton, J. Lenges, 1992 Containing a selection of papers presented at an international conference, this volume reviews the need for increased training in the food industry in order to bridge the gap between standards in Eastern and Western Europe and the USA. Higher education is discussed, including the training of food technicians. European initiatives such as ERASMUS and Network are also described. The text includes coverage of the importance of international trade and consumer protection acts, including a description of the needs of various groups and future developments.
