

operation of the optical access device using both the optical techniques of synchronous detection and averaging the optical signals, a time-multiplexed computer algorithm, requiring an expenditure of 10 to 20 ms per scan, provides a means for a fast scan. An iterative algorithm required minimization of the total rms of the signal and the gain of the signal was achieved. The signal was normalized to a value of 1.0 and the average value of the rms of the signal was found. This value is used as the initial value of the gain and the process is repeated until a desired value is reached.
