

ARTIFICIAL INTELLIGENCE

How Does Narrow AI Work?

Narrow AI is a kind of smart computer good at doing one or a few jobs. It's not like general AI, which can do a lot of things and act like a human. Narrow AI tries hard to get a particular goal done by using special math tools that help it learn from information. The kind of math tool it uses depends on the job it needs to do and what kind of information it's looking at.

One of those math tools is called machine learning. It works by teaching the smart computer how to use information to make good choices. First, the smart computer looks at some examples of information, then it uses such information to help it decide what to do next.

There are different ways a smart computer can use machine learning. One way is called "supervised learning." This means the smart computer looks at information that's already been sorted into groups, and then it uses such information to sort new things into the right groups too. For example, it might learn how to tell pictures of cats from pictures of dogs.

Another way the smart computer can learn is called "unsupervised learning." This means the smart computer looks at a bunch of information that hasn't been sorted yet, and then it tries to figure out what group things belong to on its own. For example, it might learn how to tell what things people like to buy online.

The third way the smart computer can learn is called "reinforcement learning." This means the smart computer gets feedback on whether it did a good or bad job, and then it learns from that feedback to make better choices next time. For example, it might learn how to play a game by getting points for good moves and losing points for bad moves.
