Advances in crustacean research from the 10th International Crustacean Congress Kareen E. Schnabel, Rachael Peart, 2025-01-06 Every four years the Crustacean Society (TCS) hosts an International Crustacean Congress (ICC) where international delegates share research covering a broad range of disciplines related to our world's Crustacea. In May 2023 the International Society of Invertebrate Reproduction and Development (ISIRD) and TCS jointly held the 10th ICC for the first time in Aotearoa New Zealand, hosted by the Museum of New Zealand Te Papa Tongarewa and the National Institute of Water Atmospheric Research (NIWA). The program was dedicated to the dissemination of all aspects of crustacean research and to promoting the exchange of information and ideas related to carcinology. Crustaceans are among the most abundant and diverse organisms on Earth and are at the forefront of international studies of neurobiology, aquaculture, toxicology, biosecurity, biodiversity, evolution and many others.

Nucleic Acids and Molecular Biology Fritz Eckstein, David M. J. Lilley, 2012-12-06 Molecular biology is one of the most rapidly developing and at the same time most exciting disciplines. The key to molecular biology lies in the understanding of nucleic acids, their structure, function and interaction with proteins. Nucleic Acids and Molecular Biology keeps scientists informed of the explosively growing

information and complies with the great interest in this field by offering a continued high standard of review A substantial part of this volume has been devoted to the analysis of different aspects of nucleic acid protein interactions including RNA protein interaction

Applicative and Ecological Aspects of Mycorrhizal Symbioses Mustafa Morsy, Sunil Mundra,2024-11-22 Mycorrhizal symbioses a mutual association between plants and fungi plays a vital role in shaping and balancing the ecosystem of our planet Approximately 80% of vascular plant species form mycorrhizal associations between their roots and soil borne fungi Moreover such association between plants and mycorrhizal fungi drastically affect the water and nutrient absorption by plant roots as well as provides protection against soil borne pathogens Hence mycorrhizal symbioses might be advantageous for plants and our ecosystem under the drastically changing climate which is threatening

and distorting our ecosystem Threats to our ecosystem should therefore encourage investigations and inventories of mycorrhizal diversity function and their application Although numerous research has been done in this area some issues remain unsolved because of the dramatic diversity of mycorrhizal associations along with their specificity in response to host plants especially under different climate and soil conditions in different ecosystems Therefore the collection under this research topic aim to provide up to date applicative thorough studies on mycorrhizal symbioses through ecological perspective For this Research Topic we welcome both reviews and original articles that address the following research agenda but not limited to the diversity structure and function of mycorrhizal fungi associated with plants trees crops in different ecosystems the impacts of mycorrhizae on plant species under different environmental condition i e warmer climate drought the interaction between mycorrhizal fungi and plant species in soil with different water level nutrients and salinity the application of the mycorrhizae on regeneration and dynamics of ecosystems as well as their biomass production

Tranbarger,Mark L. Tucker,Jeremy A. Roberts,Shimon Meir,2017-11-22 Plant organ abscission is a developmental process regulated by the environment stress pathogens and the physiological status of the plant In particular seed and fruit abscission play an important role in seed dispersion and plant reproductive success and are common

domestication traits with important agronomic consequences for many crop species. Indeed, in natural populations, shedding of the seed or fruit at the correct time is essential for reproductive success, while for crop species the premature or lack of abscission may be either beneficial or detrimental to crop productivity. The use of model plants, in particular *Arabidopsis* and tomato, have led to major advances in our understanding of the molecular and cellular mechanisms underlying organ abscission, and now many workers pursue the translation of these advances to crop species. Organ abscission involves specialized cell layers called the abscission zone (AZ) where abscission signals are perceived and cell separation takes place for the organ to be shed. A general model for plant organ abscission includes: 1) the differentiation of the AZ; 2) the acquisition of AZ cells to become competent to respond to various abscission signals; 3) response to signals and the activation of the molecular and cellular processes that lead to cell separation in the AZ; and 4) the post-abscission events related to protection of exposed cells after the organ has been shed. While this simple four-phase framework is helpful to describe the abscission process, the exact mechanisms of each stage, the differences between organ types and amongst diverse species, and in response to different abscission-inducing signals are far from elucidated. For an organ to be shed, AZ cells must transduce a multitude of both endogenous and exogenous signals that lead to transcriptional and cellular and ultimately cell wall modifications necessary for adjacent cells to separate. How these key processes have been adapted during evolution to allow for organ abscission to take place in different locations and under different conditions is unknown. The aim of the current proposal is to present and be able to compare recent results on our understanding of organ abscission from model and crop species and to provide a basis to understand both the evolution of abscission in plants and the translation of advances with model plants for applications in crop species.

Principles of Cancer Biotherapy R.K. Oldham, 2012-12-06

At the time of the first edition of *Principles of Cancer Biotherapy*, this book represented the first comprehensive textbook on biological therapy. Whereas in 1991, when the second edition was published, there was still some doubt on the part of many oncologists and cancer researchers as to the therapeutic value of these new approaches, it is now generally agreed that biopharmaceuticals are producing major opportunities for new cancer therapies. Cancer biotherapy has truly matured into the fourth modality of cancer treatment. The third edition is now needed as a result of the tremendous progress that has been made in recent years using biologicals in cancer treatment. The book summarizes an evolving science and a rapidly changing medical practice. As we near the millennium, it now becomes possible to envision a much more diversified system of cancer research and treatment that will afford greater opportunities for patients. Some forms of cancer biotherapy use the strategy of tumour stabilization and control through continued biological therapy, akin to the use of insulin in the treatment of diabetes. This textbook illustrates new methods of thinking and new strategies for control of cancer. It is always difficult to move from past dogma to future opportunity, but this third edition of *Principles of Cancer Biotherapy* illustrates why it is so important to the patients for researchers and clinicians to explore and apply these new opportunities in cancer biotherapy.

Marker-assisted selection (MAS) in crop plants Baohua Wang, Peng Chee, Ting Peng, Muhammad Kashif Riaz Khan, 2023-03-16 **Tissue Restoration Through Regenerative Biology and Medicine** David L. Stocum, 2012-12-06 Advances in cell developmental and molecular biology and the discovery of regeneration competent cells in many non regenerating mammalian tissues have given impetus to systematic investigations that will enable us to regenerate these tissues by cell transplantation or the pharmaceutical induction of regeneration from the body s own tissues A significant avenue of research is the identification of the soluble and insoluble signals and their transduction pathways that govern the proliferation and differentiation of regeneration competent cells and the signals that inhibit their activity after injury How far can we go in our quest for regeneration We will probably be able to induce the regeneration of some tissues such as skin or even spinal cord within a few years The regeneration of others such as heart lung kidney or appendages may be more complex and difficult but we should not view them as impossible They will just take a little longer
