Introduction to Microlithography Larry F. Thompson, 1983

Handbook of VLSI Microlithography William B. Glendinning, John N. Helbert, 2012-12-02

This handbook gives readers a close look at the entire technology of printing very high resolution and high density integrated circuit IC patterns into thin resist process transfer coatings including optical lithography electron beam ion beam and x ray lithography. The book's main theme is the special printing process needed to achieve volume high density IC chip production especially in the Dynamic Random Access Memory DRAM industry. The book leads off with a comparison of various lithography methods covering the three major patterning parameters of line space resolution line edge and pattern feature dimension control. The book's explanation of resist and resist process equipment technology may well be the first practical description of the relationship between the resist process and equipment parameters. The basics of resist technology are completely covered including an entire chapter on resist process defectivity and the potential yield limiting effect on device production. Each alternative lithographic technique and testing method is considered and evaluated. Basic metrology including optical scanning electron microscope SEM techniques and electrical test devices along with explanations of actual printing tools and their design construction and performance. The editor devotes an entire chapter to today's sophisticated complex electron beam printers and to the emerging x ray printing technology now used in high density CMOS devices. Energetic ion particle printing is a controllable steerable technology that does not rely on resist and occupies a final section of the handbook.

The Physics and Fabrication of Microstructures and Microdevices Michael J. Kelly, Claude Weisbuch, 2012-12-06

les Houches. This Winter School on The Physics and Fabrication of Microstructures originated with a European industrial decision to investigate in some detail the potential of custom designed microstructures for new devices. Beginning in 1985 GEC and THOMSON started a collaboration on these subjects supported by an ESPRIT grant from the Commission of the European Community. To the outside observer of the whole field it appears clear that the world effort is very largely based in the United States and Japan. It also appears that cooperation and dissemination of results are very well organised outside Europe and act as a major influence on the development of new concepts and devices. In Japan a main research programme of the Research and Development for Basic Technology for Future Industries is focused on Future Electron Devices. In Japan and in the United States many workshops are organised annually in order to bring together the major specialists in industry and academia allowing fast dissemination of advances and contacts for setting up cooperative
