Plant Secondary Metabolite Biosynthesis Xiang Pu, Naoki Kitaoka, Shilin Chen, Carlos E. Rodríguez-López, 2024-09-02 Plant secondary metabolites are a diverse group of compounds that contribute to many important biological and ecological functions. They are synthesized by plants to interact with the biotic and abiotic environments, playing roles in plant defense, growth, and development. Additionally, plant secondary metabolites have widespread applications in human industries, including food additives, cosmetics, dyes, insecticides, and drugs. The biosynthesis of these compounds is complex and dynamic, with more than one million secondary metabolites identified from terrestrial and aquatic plants. Despite their diversity, plants produce limited quantities of secondary metabolites in a metabolic cost-saving way. This has greatly limited their commercial

production and the overexploitation of source plants has raised concerns about their sustainability and highlighted the need for advanced research. Recent advances in genomics, transcriptomics, metabolomics, and other omics technologies have revolutionized our understanding of plant biology, enabling the discovery of new plant secondary metabolites and their biosynthetic pathways. Functional genomics approaches such as genome-wide association studies, transcriptome analysis, and gene editing have facilitated the identification and characterization of genes and enzymes involved in the biosynthesis of specific secondary metabolites. Metabolic engineering and synthetic biology approaches have enabled the manipulation of plant secondary metabolism to improve the yield and quality of specific metabolites of interest or to produce them in heterologous cultures. These advances have created new opportunities for the sustainable production and utilization of plant secondary metabolites.
